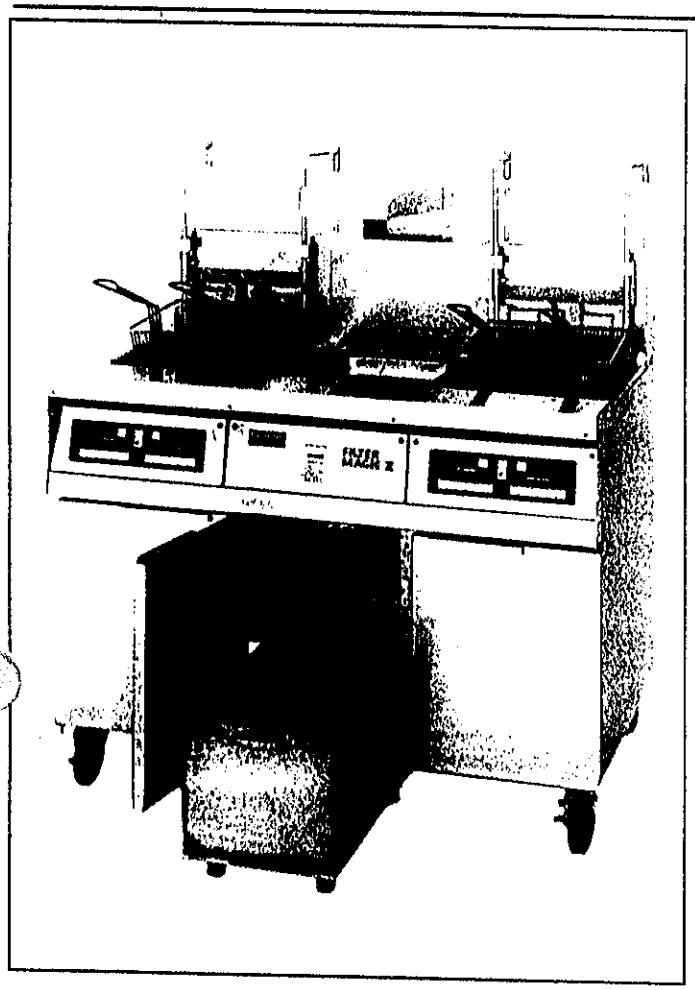
# FILTER MAGIC® SYSTEM
## For Gas and Electric Fryers
### MJH50, MJ35G, MJ45E, MJCFE, G18FB, G24FB, H14, H17, H22, H14TD, H17TD, H22TD



- **Extends shortening life**
- **Fast, safe, easy to operate**
- **Automatic, hands-off filtration**
- **Convenient built-in, full-sized or undercounter filter cabinet**

The Frymaster Filter Magic® System is specifically designed to extend shortening life. Filter Magic® does it fast, safely, simply; reducing operating costs and yielding a more consistent, higher-quality product.

Fifty pounds (28 litres) of oil can be automatically filtered completely in about three minutes, while other fryers in the system are still in use. Any fryer in the battery can be filtered without moving the filter from fryer to fryer.

The process is as easy as: 1. Switch off the fryer; 2. Open drain valve; 3. Start filter pump. No special training required, nothing hot or messy to handle. Filter Magic® automatically filters oil as Frymaster's exclusive Power Shower™ directs jets of hot oil down every inch of the frypot, flushing crumbs and sediment into the filtering system. After filtering, fresh oil is automatically pumped back into the frypot.

Filter Magic® is available in full-sized and undercounter cabinets that can be batteried to either side of most Frymaster gas and electric fryers. The full-sized cabinet can be purchased with cut-out for optional cafeteria-style or scoop-type pan and a rod-style or bulb-type heat lamp can be mounted to the cabinet, making a complete warming station.

Up to six of the following same Frymaster models can be batteried to each side of the Filter Magic System®: MJH50, MJ35G, MJ45E, H14, H17, H22, H14TD, H17TD. Up to four MJCFE, G18, G24 fryers can be batteried to each side of a Filter Magic System®.

## STANDARD FEATURES

- **Power Shower™**
- **1/3 H.P. Motor With 5.5 GPM**
- **Stainless Steel Inner and Outer Filter Pans**
- **Filter Heater**
- **Filter Screen**
- **Crumb Screen**

## HOW TO SPECIFY

| | |
|---|---|
| FM-A | Full sized Filter Magic system to battery with MJH50, MJ35G, MJ45E, H14, H17, H22, EPH14, EPH17 |
| FM-B | Full sized Filter Magic system to battery with MJCFE |
| FMU-A | Undercounter Filter Magic system to battery with MJH50, MJ35, MJ45E, H14, H17, H22, EPH14, EPH17 |
| FMU-B | Undercounter Filter Magic System to battery with MJCFE |
| FB18/24 | Full sized Filter Magic System to battery with G18FB and G24 FB |

FILTER MAGIC CABINET CAN BE LOCATED ANYWHERE IN THE BATTERY --PLEASE SPECIFY.

## OPTIONAL ACCESSORIES

- ☐ Rod-style heat lamp assembly
- ☐ Bulb-style heat lamp assembly
- ☐ Cafeteria-style dump pan
- ☐ Perforated scoop-type dump pan
- ☐ Filter envelopes
- ☐ Casters
- ☐ Filter cover
- ☐ Stainless steel door, cabinet, sides

## STANDARD ACCESSORIES

- Filter paper (25 Ct.)
- Filter powder (100 1-cup applications)
- Filter brush
- Fryer's friend (cleanout rod)

## NOTES

- Supply voltage for filter is obtained from the line voltage of fryer, except for 480V, which will have a separate 120V, 60Hz (9.0 Amp) power supply cord supplied with unit.
- Control Voltage: 24V, 60Hz
- Export Supply Voltage: 220V, 50Hz (4.5 Amp)
- FB18 and FB24 not available for export
- Filter Magic systems are also available on fryers equipped with computers and/or automatic basket lifters.
- For applications where space is premium, please see Frymaster's FootPrint® Filtration specifications.

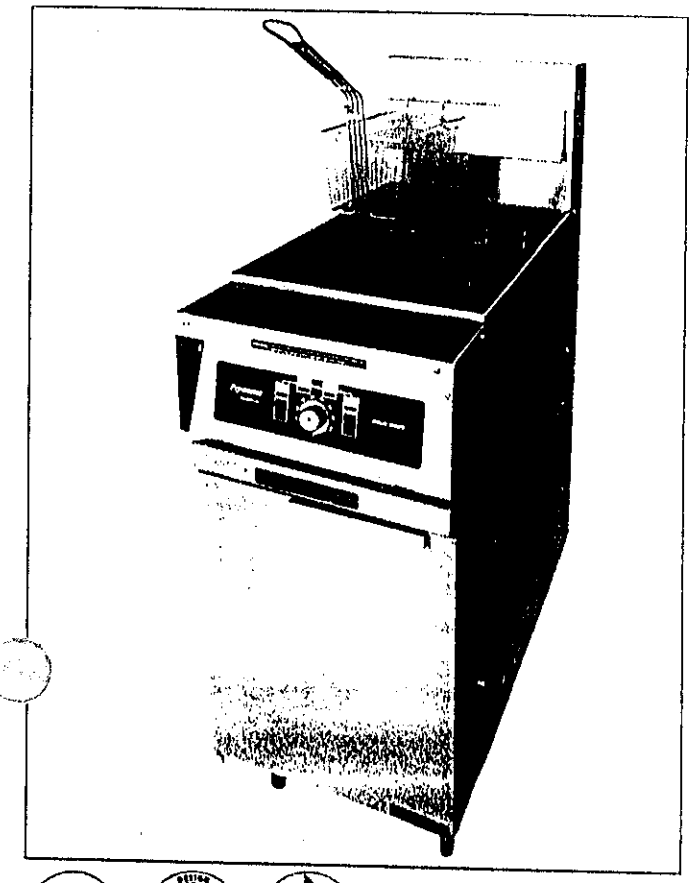
ITEM NO. #42

**Frymaster**

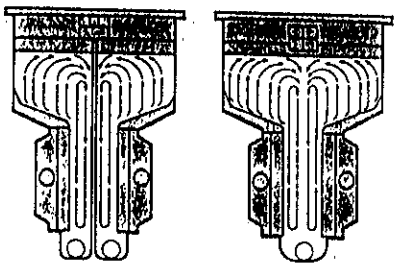
A WELBILT Company

# MJH50 and MJH50-2 Gas Fryers

## Specifically designed for high production frying



ISO 9002



MJH50-2 MJH50

*Unique frypot design with deep cold zone and turbocharged, infrared burners.*

*STANDARD FEATURES*

- *Electronic ignition, melt cycle*
- *Open-pot design (split or full), no tubes, easy-to-clean*
- *Centerline temperature sensor, 7- to 10-second response to loads*
- *Solid-state controller*
- *Deep cold zone*
- *Low flue temperature*
- *Boil-out mode*
- *Lifetime limited warranty on stainless frypot*
- *Turbo jet infrared burners*

The MJH50 has a maximum 50-lbs. (25 litres*) shortening capacity. The frying area is 14 x 15 in. (356 x 381 mm). This 80,000 BTU (84.4 megajoules) (23.4 kW) model is designed for high-volume frying with maximum fuel efficiency. The solid-state controller assures pinpoint accuracy of shortening temperature, extending shortening life and producing a uniformly-cooked product. The sensor is mounted in the center to permit quick sensing of any temperature drop caused by cold food placed in either side of the cooking area. The infrared power burner directs its heat on a large heat transfer area to fry more product with less fuel consumption. The open-pot design has no hard-to-clean tubes and can easily be wiped down and cleaned by hand.

The large cold zone catches crumbs and sediment from the frying area. Since these particles are trapped in the cold zone, they do not carbonize, contaminate shortening or cling to fried products.

The MJH50 model uses a 120V (220V for export) supply. Multiproduct frying computers, basket lifters and Filter Magic® or FootPrint® Systems are available. Up to six fryers can be batteried to the right side of a single FootPrint System. Up to six fryers can be batteried to either side of a Filter Magic System.

The solid-state controls, electronic ignition and melt cycle are standard.

Boil-out mode is activated by setting the temperature to 200°F.

Each side of the MJH50-2 -- split pot fryer operates on 40,000 BTU/hr. (42.2 megajoules) (11.7 kW), has a maximum shortening capacity of 25 lbs. (12 litres*), and has a frying area of 6-1/2 x 15 inches (165 x 381 mm). This fryer has all of the features and options of the MJH50 and gives the operator the discretion of using only half the fryer

**Litre conversions are for solid shortening at 70°F (21°C).*

**NOTES**

Supply Voltage 120V 60Hz -- Control Voltage 24V 60 Hz.
120 VAC 5 ft. (1.5 m) grounded cord set provided.
Recommended minimum store manifold pressure to be 6" W.C. for NAT Gas, and 11" W.C. for L.P. Check plumbing codes for proper supply line sizing to attain burner manifold pressure of 3.0" W.C. natural or 8.25" W.C. L.P. Incoming supply line should be 1-1/2". NOTE: All units whether single or in battery require 1" connection. Should flexible gas line be used, it must be AGA approved, commercial type and at least 1" I.D.

**CLEARANCE INFORMATION**

A minimum of 24" (610 mm) should be provided at the front of the unit for servicing and proper operation, and 6" (152 mm) between the sides and rear of the fryer to any combustible material.

**HOW TO SPECIFY**

| | |
|---|---|
| MJH50 | Control panel, solid-state controller, electronic ignition, melt cycle, sealed ON/OFF switch |
| MJH50-2 | Split pot with same features as full pot plus dual controls to operate each pot independently |
| SD | Stainless steel frypot and door, enamel cabinet |
| SC | Stainless steel frypot and cabinet sides |
| FMH50/ FMH50-2 | Filter Magic System can be batteried with up to six MJH50 or MJH50-2 or any combination of the two not exceeding six units on either side of the filter |

**OPTIONAL ACCESSORIES**

- ☐ Automatic Basket Lifters, computer or timer controlled Computer Magic® III Frying Computer (multiproduct)
- ☐ Casters
- ☐ Frypot cover
- ☐ Flexible metal connector with quick-connect coupler
- ☐ Stainless steel apron drain with basket (interchangeable right or left side)
- ☐ Sediment tray
- ☐ Screen type basket support
- ☐ Dump Station and Food Warmer
- ☐ Filter Magic® System -- Up to six split or full pots or combination can be batteried to either side of Filter Magic System
- ☐ FootPrint® System -- Up to six units; split pot, full pot, or combination can be batteried to the right side of the FootPrint System

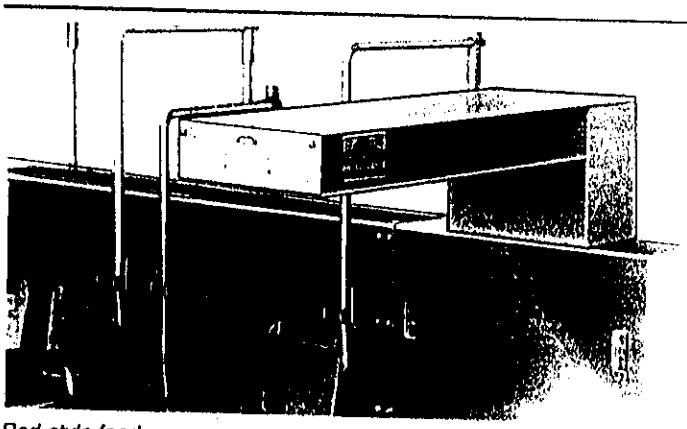
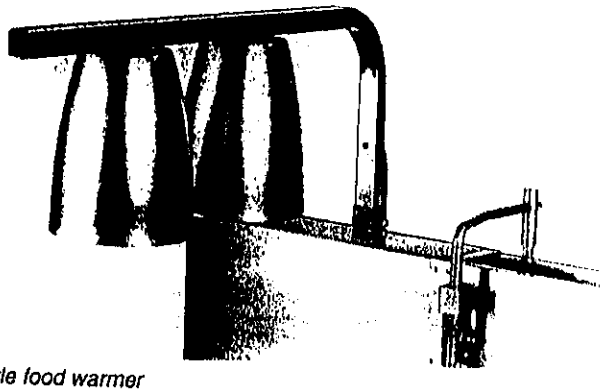
ITEM NO. #42

# Food Warmers

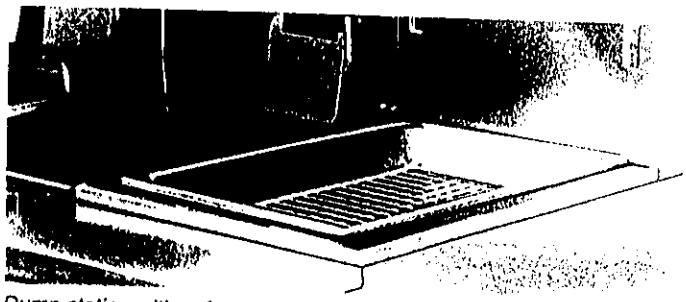
## Filter Magic®
## Food Warmers and Dump Stations



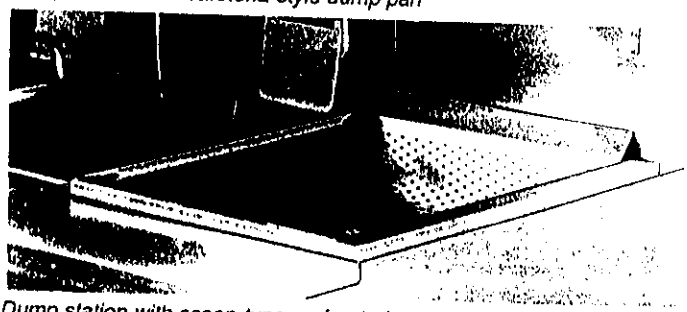
*Rod-style food warmer*



*Bulb-style food warmer*



*Dump station with cafeteria-style dump pan*



*Dump station with scoop-type perforated pan*

- Keeps food fresh and hot
- Durable construction, easy to clean
- Indicator lights "ON/OFF" switch
- Stainless steel cafe pan, 12" x 20" x 2-1/2" (305 x 508 x 64 mm) with mesh screen
- Optional scoop-type, perforated pan, 13.50" x 18.50" x 5.25" (343 x 4610 x 133mm)

THE RECTANGULAR, ROD-STYLE FOOD WARMER produces an 18" (457 mm) heat pattern over the entire length of the unit to gently warm cooked food with radiant heat to assure peak flavor without cooking or drying. The shell is manufactured with durable stainless steel and aluminum alloys and is easy to clean. "ON/OFF" switch, indicator light and a 6' (1.8m) cord set are mounted in the shell. Mounting brackets and hardware are provided for installation. This unit is NSF, UL and CSA approved and can be used with either the cafeteria-style pan with mesh screen or the perforated curved scoop pan for quick, easy bagging.

THE BULB-STYLE FOOD WARMER is constructed of aluminum alloys for long life and easy cleaning. Two attractive lamps mounted on an adjustable arm emit controlled, efficient infrared heat to keep foods hot and fresh. A 6' (1.8 m) cord set with in-line "ON/OFF" switch is provided. This unit is NSF, UL, and CSA approved and can be used with either the cafeteria-style pan with mesh screen or with the perforated, curved scoop pan for quick, easy bagging.

*Note: Unless otherwise specified, rod-style heat lamp and cafeteria-style dump pan will be supplied with Filter Magic System.*

## Supremacy Series™ Solid Door Reach-In Refrigerators and Freezers

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments. Units mounted on 4" (10.16) casters.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Glass doors shall be constructed with extruded aluminum frames. Refrigerator shall utilize insulated double-pane construction. Freezers shall utilize argon-insulated double-pane, low E construction. Glass doors shall be provided with self-closing, cam-lift style hinges, and shall be easily removable without the use of tools. Glass door cabinets shall be provided with high-output fluorescent lights.

Electronic controls shall be located behind a removable shroud facing. Main power switch shall be located on the junction box on top of the unit.

**THE FOLLOWING APPLIES TO REFRIGERATORS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall be coated to prevent corrosion. Cabinet shall maintain 34°F to 40°F (1°C to 4°C) internal temperature.

**THE FOLLOWING APPLIES TO FREEZERS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall have deep-corrugated, staged fin construction for maximum efficiency with fewer defrost cycles. Cabinet shall maintain –10°F to 0°F (-23°C to -18°C) internal temperature.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.

MODEL SRR1-GHSH

**OPTIONS & ACCESSORIES**

- Stainless steel backs
- Laminate on doors & ends
- Additional shelves and bridges
- Tray Slides
- Kick panels
- Half-size hinged glass or stainless steel doors, two doors per section
- Remote refrigeration
- Correctional Facilities package
- ERC-2 microprocessor - based controls
- 6" (15.24 cm) diameter legs (adds 2" to over height of unit)

ITEM # 45

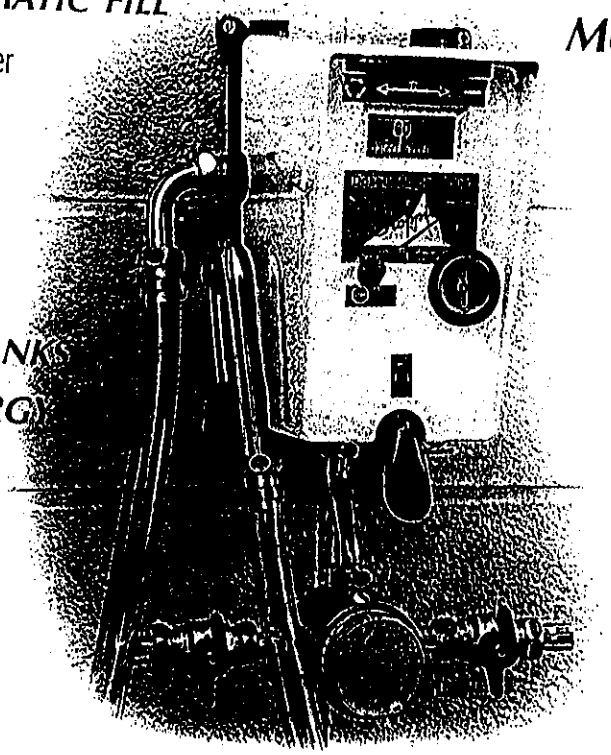
# THE BAKER'S WATER METER

## Kit «Stoppil Plus»

Quality 25 Years Technological Updating

### TIME SAVING THANKS TO AUTOMATIC FILL

Avoids wasting time (no longer reading the volume gauge or using a pail)



### MORE CUSTOMERS THANKS TO AN EXCELLENT DOUGH QUALITY

as very good volume and temperature accuracy

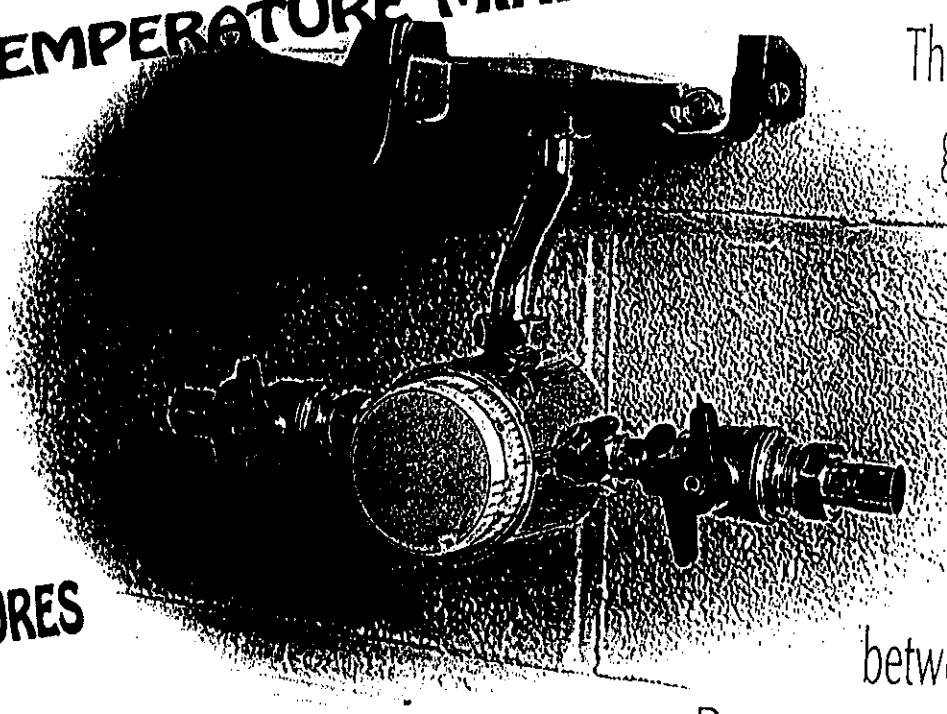
### MORE PROFITS THANKS TO A GAIN OF ENERGY AND MAINTENANCE

Allows the installation of the chiller in a cool place and far from the flour supply avoiding a bad operating of the cooling system

### MORE PRACTICAL

Avoids tiredness and spattering water (by using a pail)

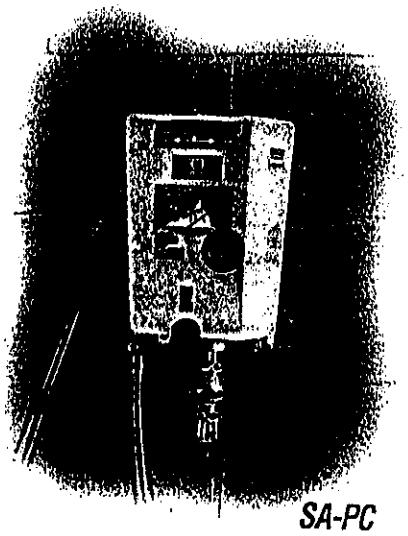
## THE TEMPERATURE MIXING VALVE



SPECIAL LOW TEMPERATURES

The knob with huge graduations by one degree guarantees quick setting and excellent accuracy between 1 and 25 Degrees

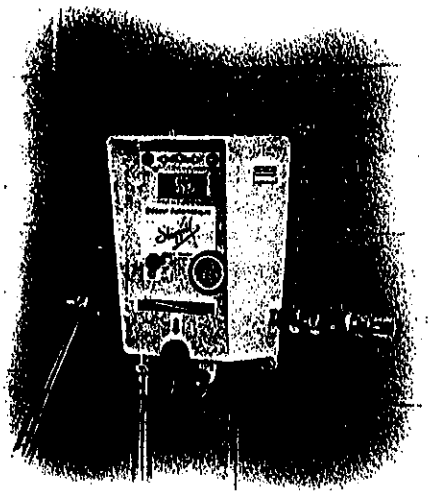
# WHICH STOPPIL WATER METER CHOOSE ?



SA-PC

## DIAL SETTING

Most simple entirely mechanical.
Precise thanks to a click-and-ratchet mechanism every 0,5 L between 10 and 100 L

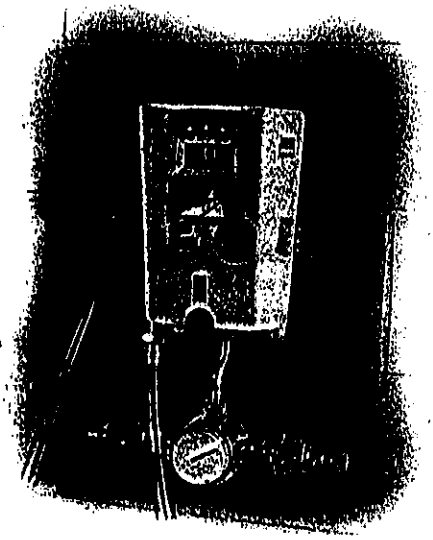


SAMM-PC

## 3 WAYS OF TEMPERATURE MIXING

***SA - Without temperature mixing*** by the water meter but a thermometer indicates the water temperature
To be plugged directly to a chiller
Required water pressure : 0,15 bar min. (1m50 distance between bottom of water storage and water meter)

***SAMM - Manual temperature mixing*** based on the system of a throttle chamber according to hot and cold water temperature .
It is easy to add hot water when starting the dough production
Required water pressure : 0,2 bar min. (2m distance between bottom of water storage and water meter)
For a quicker flow, the water chiller needs a pump or work with tap pressure.



SAMT-PC

***SAMT - Automatic temperature mixing by means of a mixing valve***

The mixing valve fitted to the water inlet allows a very precise temperature setting and an automatic temperature adjustment.

This mixing valve is especially designed for the mixing of very cold water

The knob with huge graduations (by one degree) guarantees very fast setting and very good accuracy.

Required water pressure : 1 bar (10m) minimum for a perfect working.

For chillers with a pump, the water meter requires an electrical contact called microswitch or work with tap pressure.

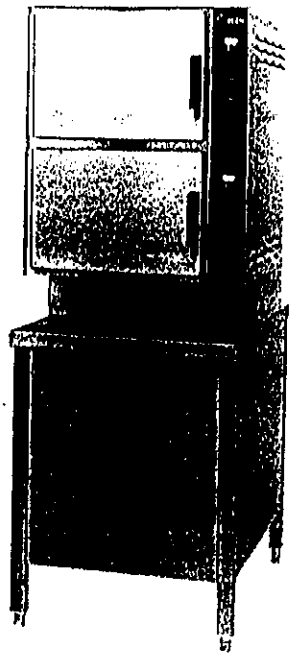
# HY-6G

GROEN

#47

6 Pan Capacity Stainless Steel Pressureless Steamer

With Twin Gas Atmospheric Steam Generators In Cabinet Base



### Description

Steamer shall be a Groen Model HY-6G stainless steel pressureless steamer with twin atmospheric 45,000 BTU/hr gas steam generators, for a total of 90,000 BTU maximum, per bulletin 71 as follows:

### Construction

Steamer cavities and cabinet base shall be all stainless steel construction with removable right side panel providing access to internal components. Steamer doors are all stainless steel with strong continuous hinge and is field reversible for left or right swing. Doors shall be insulated and provided with a one piece, replaceable seal. Easy open handle and latch shall provide positive lock and seal when door is pushed or slammed shut.

Hidden magnetic door switch cuts power to blower and reduces power to generator when the door is opened. Pan support racks shall be electro-polished stainless steel and removable for easy cleaning and to provide access to the steam generator deliming port in each cavity. Wide drip sink with condensate drain is positioned under cavity doors.

21⅝" wide cabinet base shall have stainless steel frame with removable front, side and back panels standard. Cabinet base shall be provided with 6" legs with adjustable bullet feet.

### Finish

Cabinet exterior including door shall be finished to a No. 4 uniform finish. Cavity interiors are electro-polished stainless steel. Control panel face plates shall be smudge resistant polyester film ensuring maximum ease in cleaning and maintaining an attractive appearance.

### C.S.A. Design Certification

Steamer shall be C.S.A. (formerly A.G.A.)design certified to ANSI Z83.11".

### Sanitation

Unit shall be designed and manufactured to meet NSF and known health department and sanitation codes and be NSF listed.

Unit shall allow operator to delime both steam generators through access port in each cavity without tools or service call. Push button auto-clean is standard

### Controls

Steamer cavity controls shall include an ON-OFF power touch pad; 60 minute mechanical timer with continuous steam setting, and READY light which indicates when cavity is ready for steaming. Auto-CLEAN button initiates deliming cycle.

### Performance Features

Each steamer cavity shall have a powerful side-mounted blower, which increases steam velocity and provides efficient steam distribution throughout cavity and between loaded pans. Steam generators deliver approximately 15,000 BTUs/hour input per 2½" deep steam pan.

Heat up time to READY shall be 7-10 minutes or less, under normal conditions. Cavities are kept warm and ready for instant steam between loads. No cavity warmup required after READY light comes on.

SERVICE indicator light warns operator of need to delime steam generator. Unit will shut off if water level is low. When power switch is turned "off", unit automatically blows down the steam generator to reduce sediment build-up.

### Cabinet Base Steam Source

Unit shall have twin gas heated cabinet mounted steam generators to provide atmospheric steam to the chambers at a temperature of approximately 212°F. Each steam generator has an electric low water sensor, a 45,000 BTU/hr firing rate and is 65% efficient. Unit comes standard with standing pilot with electronic ignition system.

### Pan Capacity

| Pan Size | Per Cavity | Total |
|---|---|---|
| 12 x 20 x 1" | 6 | 12 |
| 12 x 20 x 2½" | 3 | 6 |
| 12 x 20 x 4" | 2 | 4 |

### Installation

Unit requires gas service (specify natural or propane) via ½" NPT pipe or approved equivalent. Unit requires 3/4" NH cold water supply line; 1½" free venting drain; and 115 volt single phase, 4 AMP electric service. A second cold water connection is also available as an option for the spray condensor.

### Water Supply Requirements

To minimize service problems a water treatment (softening) system is recommended when water quality is found to exceed limits stated below and in operator manual.

Recommended MINIMUM water quality standards are: Total dissolved solids (TDS) content should have a value of 30 to 40 parts per million, and the water pH should be 7.0 to 9.0.

### Origin of Manufacture

Steamer shall be designed and manufactured in the United States.

### Short Form

Unit shall be a Groen HyPerSteam pressureless steamer Model HY-6G with twin, independent gas heated steam generators mounted in 21⅝" wide cabinet base, per bulletin 71. All stainless steel construction with two steam cavities, each powered by its own independent atmospheric steam generator with powerful blower to circulate steam within cavity and separate operating controls, including: 60 minute mechanical timer, constant steam setting, ready light and CLEAN cycle button to initiate deliming. Simple deliming through port in each cavity. Doors are field reversible, with easy open latch and hidden magnetic door switch, and wide condensate sink with drain is provided under cavity doors. Twin atmospheric steam generators require no pressure gauges or switches, and have 45,000 BTU/hr input each. Unit shall come up to steam in 7-10 minutes from a cold start, and provide true warm cavity instant steam capability. A.G.A. and C.G.A. Design Certified and NSF listed. See other side for gas, electric, water and drain connections required. Made in USA.

### Applications

*Pasta*
*Rice*
*Vegetables (Fresh and Frozen)*
*Seafood (Fresh and Frozen)*
*Poultry*
*Potatoes*
*Eggs*
*Meats*
*Reheat Cook-Chill & Prepared Foods*

## FEATURES:

One piece **Deep Drawn** sink bowl design.

All sink bowls have a large liberal radii with a minimum dimension of 2" and are rectangular in design for increased capacity.

## CONSTRUCTION:

All TIG welded.

Welded areas blended to match adjacent surfaces and to a satin finish.

Die formed Countertop Edge with a 3/8" No-Drip offset.

One sheet of stainless steel is used. There are no welded seams other than corners.

## MECHANICAL:

Faucet supply is 1/2" IPS male thread hot and cold.

K-59 splash mounted 4" O.C. gooseneck faucet chrome plated furnished with aerator.

K-6 stainless steel basket drain 1-1/2" IPS.

K-26 lever operated drain and built-in overflow with plastic overflow tube and spring clamps.

7-PS-14 P-Trap is 1 1/2" chrome plated.

7-PS-12 Soap Dispenser.

Towel dispenser with hinged cover. Unit uses standard C-fold towels.

Sink bowl is 10" x 14" x 5".

## MATERIAL:

Heavy gauge type 304 series stainless steel.

Wall mounting bracket is stainless steel and of offset design.

All fittings are brass / nickel plated unless otherwise indicated.

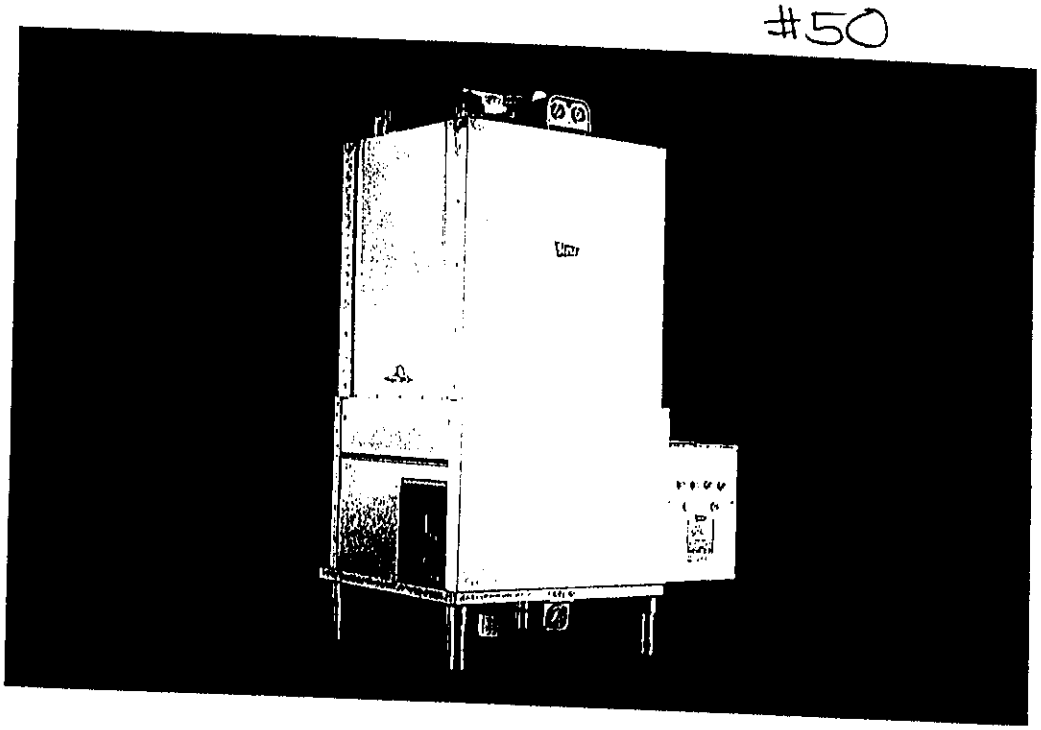
*Stero's heavy duty single tank pot, pan and utensil washer provides fully automatic and adjustable operation.*



### Large Volume, High-capacity and Automatic

- Convenient door height and width allow for easy entry of even the largest utensils.
- Wash and rinse cycles can be adjusted and manually controlled to handle hard to clean ware.
- High capacity 3 HP pump and motor create a waste stripping wash and rinse pattern.

### Designed for Easy Operation

- Counter balanced doors easily open and close.
- Push through design and stainless steel racks ease washing process.
- Easy to reach mounted control panel offers automatic and manual controls.
- Easy to read temperature gauges monitor all water temperatures.

### Powerful Cleaning Action

- Produces 25 large volume 24 x 28 inch racks of clean and sanitized ware per hour.
- Revolving upper and lower wash arms direct 180 gallons of highly concentrated spray over the ware every minute.
- Thoroughly sanitizes with 180 degree final rinse that also enables the ware to dry quickly.
- Automatic wash and rinse cycles can be bypassed with manual controls to eliminate hard to remove soil.

### Standard Safety Features

- Door safety switch will prevent the machine from running unless the doors are fully closed.

### Standard Equipment Engineered for the End User

- Type 304, 18-8, #4 stainless steel tank and hood.
- Stainless steel frame and legs.
- Enclosed adjustable stainless steel feet.
- Stainless steel front enclosure panel.
- Rack complement includes stainless steel racks: one basket rack, one general utility rack, one counter pan rack and one bun pan rack.
- Stainless steel strainer pans filter wash and rinse water.
- 3 HP, drip-proof motor has overload protection, extended stainless steel shaft, sealed ball bearings and manual reset buttons.

Complete internal plumbing and wiring.

### Tank Heat Options

Electric tank heat, thermostatically controlled with low water cut-off.

- Steam injector, thermostatically controlled and equipped with a steam silencer and low water cut-off.
- Steam coils, thermostatically controlled, provide for a completely closed heating system and is equipped with low water cut-off.
- Infrared gas tank heat thermostatically controlled and equipped with low water cut-off.

### Miscellaneous

- Auto Fill provides automatic initial fill.
- Kit #55, a pre-plumbed and installed plumbing kit that includes a pressure regulating valve, pressure gauge and shock arrester.
- U-31-A-C space saving corner operating machine can be ordered at extra cost.

▲ Powermite installations above 2,000 ft. will reduce the above capacities and may require orifice changes to meet IAS safety compliance. Consult "Installation and Operating Manual" for sizing adjustments and orifice changes.

This selector chart is based on 40°F. and 70°F. temperature rises, 20 psi flow pressure and minimum rinse cycle timer setting in NSF listing.

All booster heaters are rated at 100% of the capacity of the dishwashers as recommended by the National Sanitation Foundation. Where make up water for wash tank is provided from final rinse supply, chart recommendations are based upon this additional demand (not over 2 GPM) as required by NSF.

All sizings shown are that of the dishwasher manufacturers. Hatco Corporation is not responsible for incorrect sizing applications.

**SIZING CALCULATION**

RULE OF THUMB FOR HATCO ELECTRIC BOOSTER WATER HEATERS: $\frac{GPH}{10}$ = kW 40°F. rise

ITEM# #50c

# IMPERIAL ELECTRIC BOOSTER WATER HEATERS

Models S-6, -7, -9, -12, -13, -15, -17, -18, -24, -27, -30, -36, -39, -40, -45, -54, -58

The Hatco Imperial Electric Booster Water Heater combines quality construction and rugged dependability to provide up to 600 GPH (2300 LPH) of sanitizing rinse water. Dishes and flatware *air-dry* instantly to save time, space and money. Storage capacity is 16 gallons (60 liters).

## FLEXIBILITY

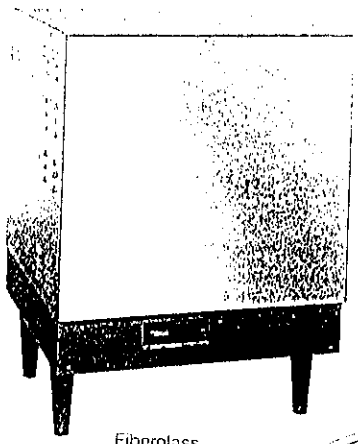
Models available from 6kW to 58.5kW in 208, 240 and 480 volts with other voltages available. The Imperial Electric Booster Heater thermostats can be lowered to a 140°F (60°C) setting for low-temp dishmachines.

Service area is accessible from the front to permit easy installation, even next to other equipment.

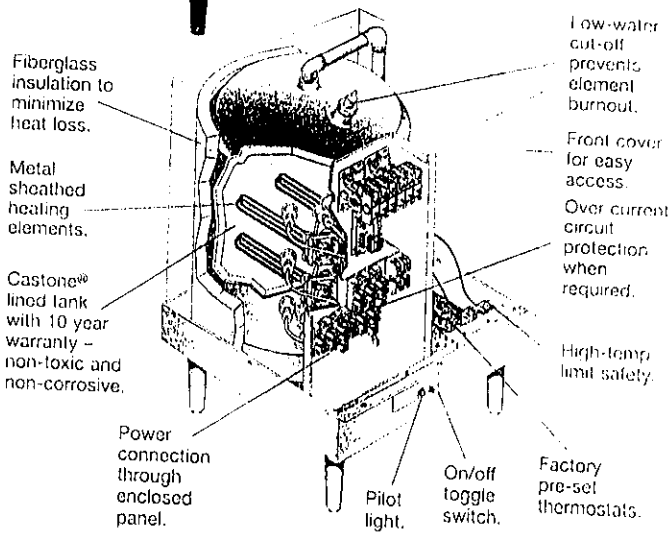
## QUALITY

The following features assure the finest performance for years to come.

- All models include a Castone® lined tank with a 10 year limited warranty.
- Features include a temperature/pressure relief valve, a cast iron pressure reducing valve, two temperature/pressure gauges, a high temperature limit control, pilot indicator light, on-off switch and a low water cut-off to prevent element burnout due to low water condition.
- Each booster has a built-in heat trap and fiberglass insulation to minimize heat loss.
- Low water protection prevents heating element burnout, and alerts operator to low water condition.
- Hatco electric booster heaters are factory pre-plumbed and pre-wired with calibrated immersion thermostats and high temperature limit switch.
- A stainless steel front panel and powder coated silver gray hammertone body is standard on all Imperial models.



Model S-54



Water Temperature Recovery Table

| Imperial Model | 40°F (22°C) Rise | 70°F (39°C) Rise |

| S-54 | 542 gph (2052 lph) | 310 gph (1174 lph) |
| S-58 | 588 gph (2226 lph) | 335 gph (1268 lph) |

## WATER QUALITY REQUIREMENTS

Incoming water in excess of 3.0 grains of hardness per gallon (GPH) (.75 grains of hardness per liter) must be treated and softened before being supplied to booster heater(s). Water containing over 3.0 GPH (.75 GPL) will decrease the efficiency and reduce the operating life of the unit.
*Note: Product failure caused by liming or sediment buildup is not covered under warranty.*

* Only 6, 7 & 9kW Models, 208 and 240 volts only, can be field converted to single phase (units are shipped 3-phase open delta). Larger branch circuit required than for balanced 3-phase of equal kW. (Balanced 3-phase available, consult factory.)
† 17.2kW Models available in 208v 3-phase only.
§ 18kW Models not available in 208v 3-phase.
* Not available in 208v single phase.
** Not available in 208v or 240v single phase.

## OPTIONS (NOT FOR RETROFIT)

- ❑ All Stainless Steel Body and Base

## ACCESSORIES

- ❑ Blended Phosphate Water Treatment System
- ❑ Shock Absorber – To Reduce Water Hammer
- ❑ Brass Pressure Reducing Valve with By-Pass
- ❑ Floor Mounting Hardware
- ❑ Adjustable Stainless Steel Legs 6" to 8" (15 to 20 cm)

## ARCHITECT SPECS

### Electric Booster Water Heaters

The Electric Booster Water Heater to supply the final 180°F (82°C) rinse for the dishwasher shall be a Hatco ....Model No. ....as manufactured for commercial use by the Hatco Corporation, Milwaukee, WI 53234 U.S.A.

The booster shall have the capacity to heat ....gph (lph) from ....°F to 180°F (....°C to 82°C) and it shall be rated at ....kW, ....volts, ....phase. The tank shall be designed for a working pressure of 150 psi (1034 kPa) and include a Hatco Castone® lining.

The heater shall be complete with all internal plumbing, including ¾" NPT pipe and fittings for inlet and outlet. All controls shall be built-in, including contactors and prewired in accordance with UL #1453 and NEC 422-27. Proper surface mounting circuit breaker or fused disconnect switch shall be provided by electrical contractor.

Electric heating elements shall be metal sheathed, controlled by close tolerance immersion thermostats. The booster shall be protected with high temperature limit switch (ECO) and low water cut-off.

The heater shall consist of stainless steel front and silver gray hammertone body with standard 6" (15 cm) legs (or stainless steel body, base and stainless steel adjustable legs).

The heater shall include a temperature/pressure relief valve, high-temperature pressure reducing valve with bypass, indicating temperature/pressure gauges and shock absorber.

# IMPERIAL ELECTRIC BOOSTER WATER HEATERS

Models S-6, -7, -9, -12, -13, -15, -17, -18, -24, -27, -30, -36, -39, -40, -45, -54, -58

#51a

CAN WASH

The Hatco Imperial Electric Booster Water Heater combines quality construction and rugged dependability to provide up to 600 GPH (2300 LPH) of sanitizing rinse water. Dishes and flatware *air-dry* instantly to save time, space and money. Storage capacity is 16 gallons (60 liters).

## FLEXIBILITY

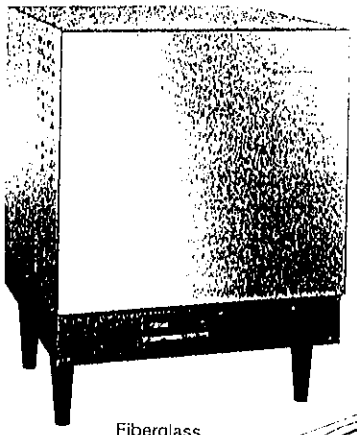
Models available from 6kW to 58.5kW in 208, 240 and 480 volts with other voltages available. The Imperial Electric Booster Heater thermostats can be lowered to a 140°F (60°C) setting for low-temp dishmachines.

Service area is accessible from the front to permit easy installation, even next to other equipment.

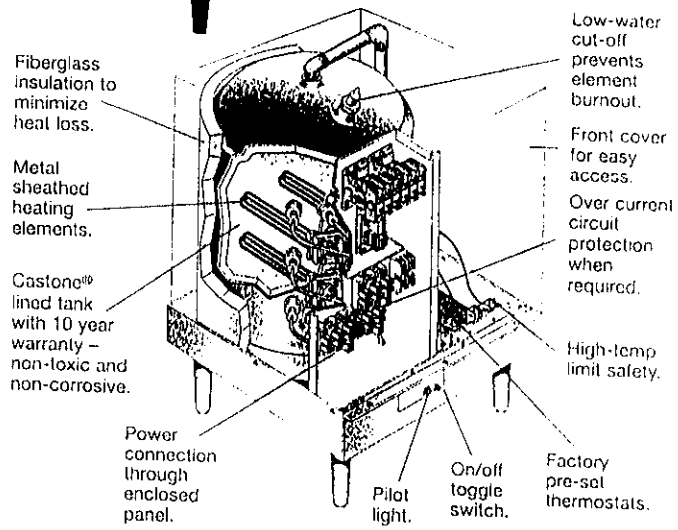
## QUALITY

The following features assure the finest performance for years to come.

- All models include a Castone® lined tank with a 10 year limited warranty.
- Features include a temperature/pressure relief valve, a cast iron pressure reducing valve, two temperature/pressure gauges, a high temperature limit control, pilot indicator light, on-off switch and a low water cut-off to prevent element burnout due to low water condition.
- Each booster has a built-in heat trap and fiberglass insulation to minimize heat loss.
- Low water protection prevents heating element burnout, and alerts operator to low water condition.
- Hatco electric booster heaters are factory pre-plumbed and pre-wired with calibrated immersion thermostats and high temperature limit switch.
- A stainless steel front panel and powder coated silver gray hammertone body is standard on all Imperial models.



Model S-54



Water Temperature Recovery Table

# 3CS SANITIZING SINK HEATERS

Models 3CS-3, 3CS-4, 3CS-6, 3CS-9, 3CS-3B, 3CS-4B, 3CS-6B, 3CS-9B

The Hatco 3CS Sanitizing Sink Heater makes manual warewashing faster and more convenient. It maintains a continuous supply of sanitizing rinse water without taking up valuable sink space.

## FLEXIBILITY

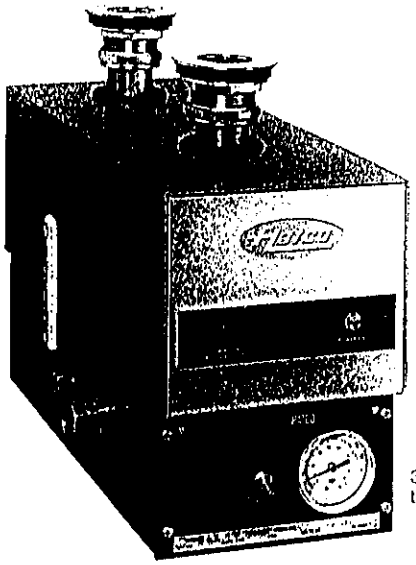
Designed to fit under the center of the sink, the 3CS is perfect for 3 or 4 compartment sinks, pot and pan sinks and bar sinks.

The 3CS features a unique dual reservoir system. One reservoir contains the heating element and should always be filled with water. The other reservoir traps and collects soil carried from other sink compartments. This reservoir is easily emptied after each use by a convenient drain.

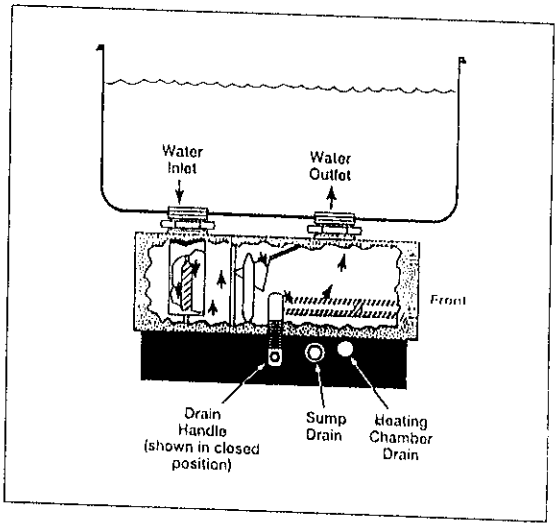
## QUALITY

The following features assure the finest performance for years to come.

- All models include stainless steel front, powder coated silver gray hammertone body and convenient side drain.
- Every Hatco 3CS is equipped with an ECO (Energy Cut-Off) wired into the electrical circuit. This built-in protection "breaks" the power to the elements if the temperature of the water goes above the normal thermostat setting.
- An on/off toggle switch activates the heater and a yellow light indicates when power is on. A red light is an overtemp indicator pointing out the need to refill the unit with water and reset the unit.
- Each 3CS model features a stainless steel tank with a 5 year warranty.
- Available with an optional temperature monitor or temperature light that indicates when water reaches the sanitizing temperature.
- The 3CS is shipped ready to install with all gaskets and fittings.



3CS-6 with optional temperature monitor



## WATER QUALITY REQUIREMENTS

Incoming water in excess of 3.0 grains of hardness per gallon (GPH) (.75 grains of hardness per liter) must be treated and softened before being supplied to booster heater(s). Water containing over 3.0 GPH (.75 GPL) will decrease the efficiency and reduce the operating life of the unit.

*Note: Product failure caused by liming or sediment buildup is not covered under warranty.*

## SIZING INFORMATION

For a Sink Heater: 2000 watts per sq. ft. (2,2 watts per sq. cm) of vessel top.

3CS Sink Heaters are sized based on 140°F (60°C) supply water with a 30 minute preheat period to reach the sanitizing temperature. Sink Heaters are mounted in the center of the third compartment sink with standard plumbing fittings provided. Two 2" (5 cm) diameter holes are required for these fittings and a full size template is provided to locate holes in the sink. The 3CS Sink Heater is easily attached to the plumbing fittings with self contained unions.

## OPTIONS (NOT FOR RETROFIT)

- ❑ All Stainless Steel Body and Base
- ❑ Temperature Monitor (Not Available with Light)
- ❑ Temperature Light (Not Available with Monitor)
- ❑ Wiring to CSA Specifications

## ARCHITECT SPECS

### Sanitizing Sink Heaters

The electric heater to maintain the final sanitizing rinse in a third compartment sink shall be a Hatco Model 3CS as manufactured by the Hatco Corporation, Milwaukee, WI 53234 U.S.A.

The Third Compartment Sink Heater shall be rated at ....kW, ....volts, ....phase. The heater shall be complete with all internal plumbing and wiring ready for external installation to the bottom of sink.

The heater tank shall be of stainless steel construction and dual reservoir design; one reservoir to contain a permanently submerged heating element, the other to trap and collect soil which can be emptied easily by a convenient drain.

The sink heater shall be equipped with an on-off reset switch and optional indicator lights (or gauge) to signal operating conditions.

The heater shall consist of stainless steel front and powder coated silver gray hammertone body (or stainless steel jacket and base).

RANDELL Air Systems Kitchen Ventilation

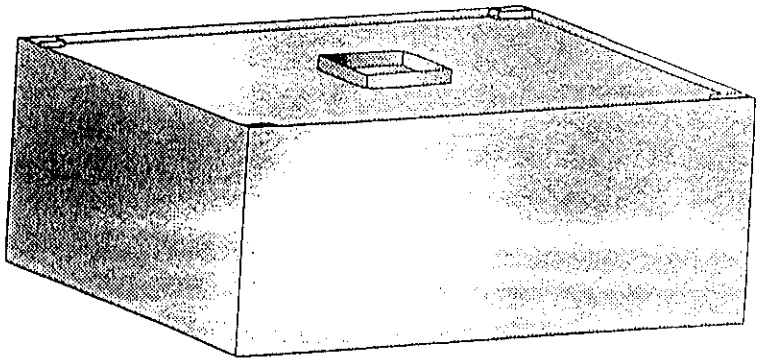
# VDW Series Condensate Canopy

#55

ITEM

DATE

NSF



## STANDARD FEATURES

- All #304 Stainless Steel Construction
- Hanging Brackets
- Perimeter Gutter With Drain
- Perforated Stainless Steel duct Protector

## OPTIONS

- 400 Series Stainless for Class II application

## OPERATION

This is a direct draw condensate hood designed to ventilate steam producing equipment. Hood is constructed with perimeter gutter and a drain at one corner.

## USE

This model hood is recommended over automatic dishwashing machines and steam producing cooking equipment without an open flame.

## Model VDW

A single shell non compensating wall hung canopy designed to capture steam vapors. Hood shall be constructed of all stainless steel. Hood shall have a perimeter gutter with a drain in back corner of gutter and perforated stainless steel duct protector.

U.S. Patent No's. 4,013,080/ Des. 244,735

**Utility Module** – Attractively merchandises and sells pastries and breads. Helps to increase check averages. Available in four widths.

- Aesthetic design, three neutral colors, dove white, pewter tan or black pearl blend in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.
- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.

**Utility Module**

| 9350 | 79" | 68" | 22 ¾" | 73" |

To be **Galley® Line** Flat Top Utility Module_____ with accessories as specified.

**GENERAL:** Unit to be self-contained, mobile Utility module for room temperature foods. Body material to be one of three neutral base colors, dove white, pewter tan or black pearl. "Matelock" self-locking and aligning end panels allow modules to be interconnected. To have recessed push handles at each end. Removable side panel on customer's side to be recessed to accept decorator panels. Server's side to be open to accept accessories. To be listed by National Sanitation Foundation and Underwriters Laboratories, Inc.

**CONSTRUCTION:** Body material to be of flame retardant ABS formed plastic fastened to galvaneal undercarriage. 14 ga. 300 series stainless steel top to have not less than #4 finish. Plate mounted 4" diameter swivel casters with toe brakes to be provided.

**NOTE:** If unit is to be used independently, add 4" to width for clearance on all specifications. Add 3 ½" to depth for folded trayslide and 3 ¼" for folded cutting board.

## Sanitary, Heavy Duty
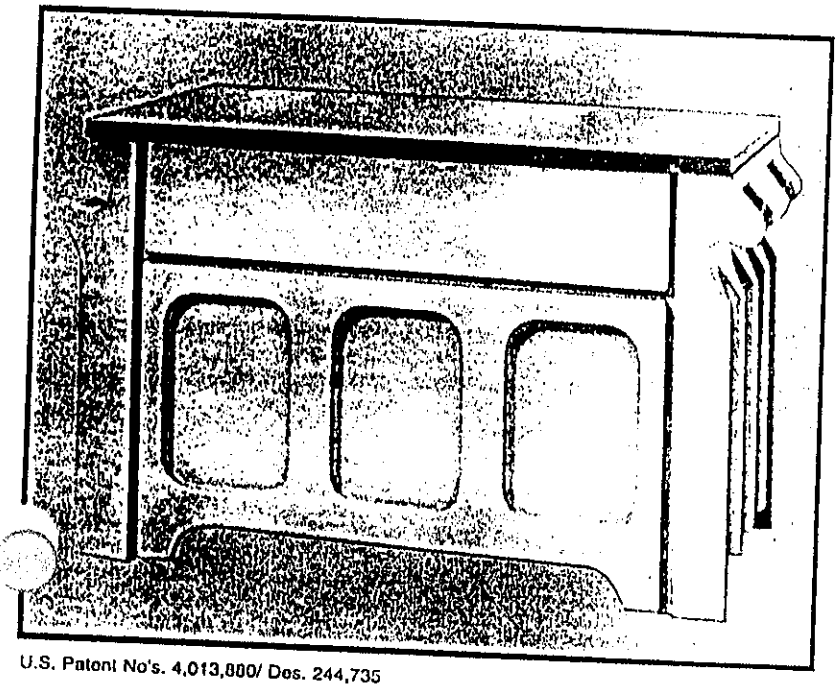
## Flat Top Utility Module

Item No. #59

**Model No. 9310**
**Model No. 9330**
**Model No. 9340**
**Model No. 9350**

A1A11420



U.S. Patent No's. 4,013,880/ Des. 244,735

**Utility Module** – Attractively merchandises and sells pastries and breads. Helps to increase check averages. Available in four widths.

- Aesthetic design, three neutral colors, dove white, pewter tan or black pearl blend in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.
- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.

**Utility Module**

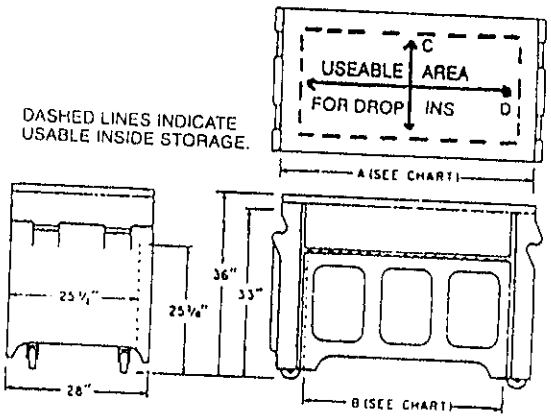
| Cat. No. | Module Size W | D | H | Shpg. Wt. Lbs. | Quantity of Decorator Panels Included |
|---|---|---|---|---|---|
| 9310 | 28" | 28" | 36" | 105 | 1 |
| 9330 | 50" | 28" | 36" | 170 | 3 |
| 9340 | 64 ½" | 28" | 36" | 195 | 4 |
| 9350 | 79" | 28" | 36" | 225 | 5 |

To be **Galley® Line** Flat Top Utility Module_____ with accessories as specified.

**GENERAL:** Unit to be self-contained, mobile Utility module for room temperature foods. Body material to be one of three neutral base colors, dove white, pewter tan or black pearl. "Matelock" self-locking and aligning end panels allow modules to be interconnected. To have recessed push handles at each end. Removable side panel on customer's side to be recessed to accept decorator panels. Server's side to be open to accept accessories. To be listed by National Sanitation Foundation and Underwriters Laboratories, Inc.

**CONSTRUCTION:** Body material to be of flame retardant ABS formed plastic fastened to galvaneal undercarriage. 14 ga. 300 series stainless steel top to have not less than #4 finish. Plate mounted 4" diameter swivel casters with toe brakes to be provided.

**SPECIFICATION DRAWING OF BASIC UNIT**



| Cat. No. | Dim. 'A' | Dim. 'B' | Dim. 'C' | Dim. 'D' |
|---|---|---|---|---|
| 9310 | 28" | 17" | 22 ¾" | 22" |
| 9330 | 50" | 39" | 22 ¾" | 44" |
| 9340 | 64 ½" | 53 ½" | 22 ¾" | 58 ½" |
| 9350 | 79" | 68" | 22 ¾" | 73" |

**NOTE:** If unit is to be used independently, add 4" to width for clearance on all specifications. Add 3 ½" to depth for folded trayslide and 3 ¼" for folded cutting board.

Model 9650, 79" width module shown with optional buffet canopy #8742

NSF

THE GALLEY PORTAFROST – Ideal for self-service foods that must refrigerated at a constant 33°F. Used for salads, cold desserts, milk shakes, cold cuts, cheeses, spreads, juices, fresh fruits and melons. Ten-inch deep cold pan provides a 3" cold blanket which keeps the hot air out and foods between 33°F and 40°F.

- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.
- Aesthetic design, three neutral colors, dove white, pewter tan or black pearl, blends in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.

# Galley® Line

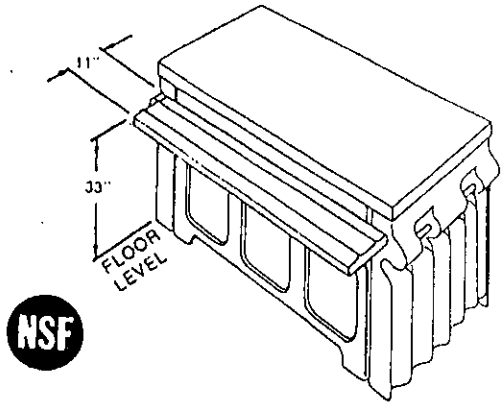
## Sanitary, Heavy Duty

## Accessories

Item No. _____

Select from any of these accessories, all especially developed for the **Galley® Line**. Whether it be buffet, cafeteria, speedline, salad bar, or soup and salad, tailor your system to your own needs. Check accessories desired, but refer to basic module specification page for accessory number and dimensions when writing specifications or preparing original purchase order.



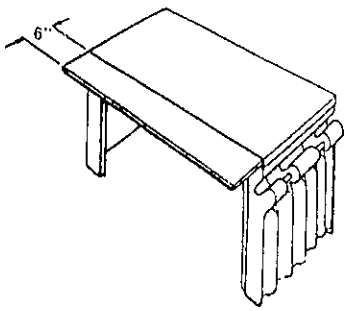
☐ **Folding Trayslide*.** To be full width x 11" wide, mounted 3" above the floor. To be constructed of 18 ga. stainless steel and to feature a three-rib reinforcement for extra strength and durability. "Drop down" stainless steel shelf brackets to be spot welded to underside of trayslide and bolted to side of basic module. When in a folded position, the trayslide is not to extend more than 3½" outward from side of basic unit. Each trayslide specified to include alignment brackets for leveling in serving line-up.

Available on all units except Tray/Silverware Module.

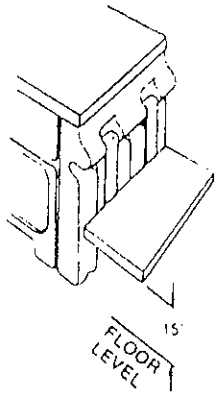
*Trayslides for Corner In-Fill Modules are "lift-off" style.

**Note:** A short trayslide must be used on the first module to the right of the Corner In-Fill Module for inside turns. Specify by width and catalog number.

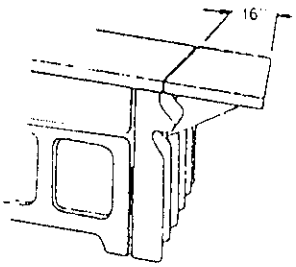
☐ **Cutting Board.** To be full width x 8" wide plastic "self-sealing" sanitary cutting board. To be removable for ease of cleaning plastic surfaces. Mounted with folding supports, permitting shelf to be folded down when not in use. To be mounted so top of surface is flush with Galley Module table top. Available on all modules except Cashier's Stations, Corner In-Fills and Tray/ Silverware Cart. Specify width and catalog number. Adds 3½" to depth of unit when folded down.

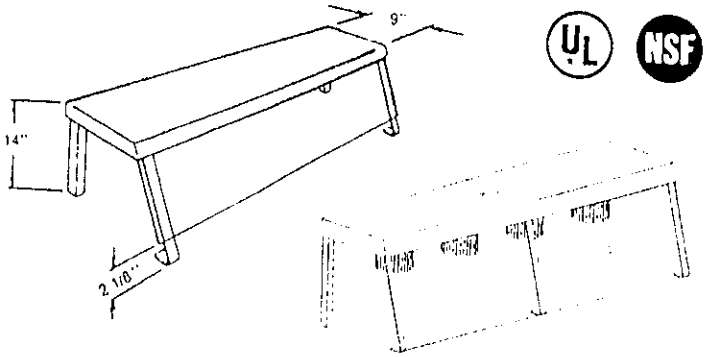


☐ **No. 8725 Low End Shelf.** To be 18 ga. stainless steel, 16"W x 28"D. Adds a place to stack trays at the beginning of a line. Self-mounting...end of module. Shelf is 15" from the floor. Holds 50 trays.



☑ **No. 8754 End Shelf.** To be 18 ga. stainless steel, 16"W x 28"D. Adds 16" additional working width to any Galley Module. Self-mounting feature permits easy installation to either male or female "Matelock" ends of module. Shelf installs flush with module table top.





☐ **Hot Food Protector.** To be full width x 14"H x 9"D. Top shelf to be one of three neutral colors, dove white, pewter tan or black pearl. Made of ABS formed plastic material and supported by two contoured stainless steel uprights. Acrylic "see-thru" breathguard is easily removed for cleaning. Available on all Hot Food, Cold Pan, Refrigerated Cold Pan and Utility Table Modules. Optional with fluorescent lights, heat strips, or heat lamps.

Amana Radarange
COMMERCIAL MICROWAVE OVENS

# RFS12MPS
## 1200 WATTS

# An Amana Classic: Heavy Duty Stainless Steel, Full Sized, Full-Featured.

- **Versatile Value**
  Amana's RFS series of ovens feature the largest capacity in their class. A large 1.2 cubic foot interior and a superior cooking pattern allow you to prepare a greater variety of menu items.
- **Durable and Dependable**
  This series is designed for use in most medium to high volume foodservice locations. A stainless steel interior and exterior and a heavy duty interlock switch are only two reasons the RFS series has a strong and loyal following.
- **Unbeatable Security**
  A full 3-year warranty on parts, labor and travel provides maximum protection and is backed by over 700 fully trained and factory authorized service contractors across North America.
- **Easy-to-Clean**
  Our exclusive sealed-in shelf is only one example why Amana Commercial products are easy-to-maintain, easy-to-use and easy-to-own.
- **Double the Simplicity**
  A X2 quantity pad simplifies operation and training and improves product quality consistency when preparing more than one order at a time.
- **Easy-to-Train, Flexible Menu**
  Programmable selection of up to 100 menu items ensures fast, consistent operation. Pads can be preset by power level and time for fast, consistent operation. 5 power levels, from full power to hold, provide flexibility for heating a wide variety of food items from frozen to fresh.

TO SPECIFY AN AMANA RFS12MPS COMMERCIAL RADARANGE MICROWAVE OVEN:
Oven shall be certified to have been designed and tested for compliance to the applicable U.S. Government Department of Health and Human Services performance standards for microwave ovens. Electrical controls for the oven shall consist of a touch control panel featuring single and multiple program pre-set timing methods, variable entry timing, five power levels and nine programming options. Programming shall be all electronic and shall not require tools. There will be no need to pull out the inner panel, match wires and post or adjust screws. There shall be 10 numbered pads, a digital readout display and START, STOP/q 02RESET, TIME ENTRY, DEFROST, HOLD, MED-HI, MEDIUM power and X2 pads. The oven shall have "instant-on" operation to provide microwave energy for the entire time selected. A "Permanent" memory shall lock in programming instructions even if power is disconnected for years. No batteries shall be used. There shall be built-in thermal protection. Oven interior shall be of top feed design with an enclosed rotating microwave antenna that distributes microwaves evenly. The side-swing door will have a see through window and shall be intrusion-proof with a slotted choke seal plus 3 interlock safety switches. Oven shall meet the standards and carry labels of NSF, U.L. and CSA. Oven shall have a five-foot power cord with 3-prong plug. Oven shall have a full three-year warranty.

### DESCRIPTION:

The Cart Line I Hot Food Cart is an attractive, functional unit designed to keep hot foods hot - at their peak of serving perfection. The modular cart base, with its drop-in heated pan, will accommodate standard steam table pans in individual 12" x 20" hot food wells that can be used wet or dry. Each well is provided with an individual thermostat control.

The attractive streamlined design, plus the variety of laminates give you a wide range of choices to complement any decor. The unmatched feature of Cart Line I is the self-locking device which eliminates loose fasteners or molding strips to lock units together. Simply push the units together; the carts will automatically lock and the top will be flush and level, regardless of the floor's condition. It's the right cart for your serving line needs.

### FEATURES:

- Fully insulated to retain heat - individual, thermostatically controlled 12" x 20" hot food wells
- Positive self-locking device - keeps tops level and equipment in place
- Fully mobile - each unit is provided with 5" dia. swivel casters, two with brakes
- Versatile - available in a wide range of sizes and a wide variety of finishes and colors
- NSF certified; UL and CSA recognized

☐ DESIGNER SERIES: The popular Designer Series option provides attractive laminate finishes with stainless steel trim. A full line of designer accessories is available including recessed casters with skirting and laminate tray slides with runners.

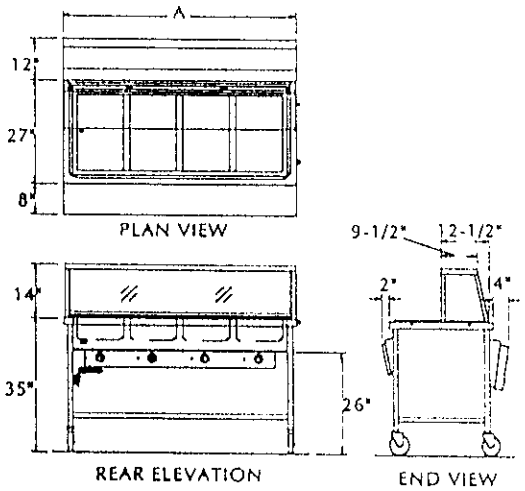
*NOTE: 1000 watt heating elements are available. All 208 volt units are available in 240 volts; CWIH-2 & CWIH-3 are also available in 120 volts - contact factory for electrical specifications.



## SPECIFICATIONS:

**TOP:** Constructed of 16 gauge, type 304 stainless steel, die-formed, welded, ground and polished. Top is provided with an opening to receive the appropriate sized drop-in hot serving unit. An integral locking device shall be provided to align and retain cart positioning when two or more carts are joined.

**BODY:** Frame construction shall be of hi-tensile stainless steel square tubing, 1-1/4" x 1-1/4". Frame sections are all welded construction, ground and polished to a uniform finish. Body is complete with front panel of plastic laminate on .050 aluminum. Owner to specify finish.

**HOT SERVING UNIT:** The cart is complete and includes a WIH series drop-in hot serving unit installed in the top. Constructed of 18 gauge, type 304 stainless steel with raised perimeter bead and solid vinyl gasket. Individual 12" x 20" hot food wells are provided, fabricated of 18 gauge stainless steel, one piece construction, all welded, ground and polished to a uniform finish. All corners are coved with a minimum 1/4" radius. Each well is provided with an 850 watt heating element.

**CASTERS:** The casters shall be 5" diameter, non-marking rubber tired, swivel type with ball bearings in both swivel and axle raceways, and provided with grease fittings. Both casters on operator's side have toe activated brakes.

**ELECTRICAL:** The unit is provided with a pre-wired single thermostat control for each well, with a pilot light. A 6' long, 3-wire cord and plug is provided, extending from the control box located under the unit, on operator's left. Available for single phase power only.

*Specifications subject to change without notice.*

## ACCESSORIES:

- SL - Tray Slide, 12" wide, stainless steel, 2-rail, fold down
- SLT - Tray Slide, 12" wide, stainless steel, 3-rail, fold down
- SLS - Tray Slide, 12" wide, stainless steel, solid, ribbed, fold down
- SLF - Tray Slide, 12" wide, plastic laminate with S/S runners, fold down
- SH - Work Shelf, 8" wide, stainless steel, fold down
- CB - Work Shelf, 8" wide, hardwood maple, fold down
- CR - Work Shelf, 8" wide, Richlite, fold down
- PRC - Protector Case
- PRCL* - Protector Case with fluorescent lights
- PRHC* - Protector Case with food warmer
- PRHLC* - Protector Case, 18" high, with heat lamps
- PRVC - Protector Case, sneeze guard only
- OSC-X/OSDC-X - Buffet style overshelf, single/ dual service
- OSC/OSDC* - Buffet style overshelf with fluorescent light, single/ dual service
- OSHC/OSDHC* - Buffet style overshelf with heat lamps, single/ dual service
- SG - Plexiglas sneeze guard
- Plexiglas end guards for protector case and buffet canopy
- ✓ S - Stainless steel front panel
- EPA - End panel, plastic laminate/ ✓ stainless steel
- ✓ RP - Removable rear panel
- RPS - Rear sliding doors
- ✓ US - Stainless steel undershelf, removable
- Front skirt with recessed casters
- End skirt
- Rear skirt
- ✓ Individual drain for each well with manifold to single valve. (Additional valves may be specified - CONTACT FACTORY.)
- ✓ Stainless steel adapter plate - specify openings
- Apron mounted remote controls
- 1000 watt heating elements in lieu of 850 watts*

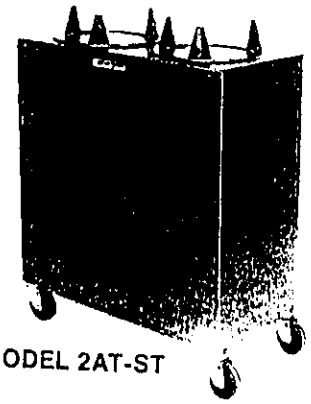
DISH

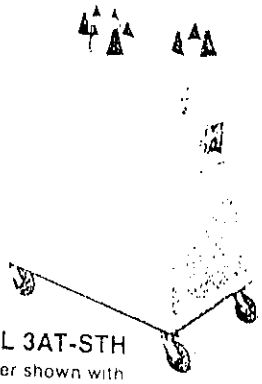
# DISPENSERS

**CABINET STYLE, MOBILE**
**UNHEATED OR HEATED, ADJUSTABLE**

CAPACITY OF EACH TUBULAR DISPENSER—
Approx. 28 to 36 bowls or 50 to 72 plates.



**MODEL 2AT-ST**



**MODEL 3AT-STH**
Dispenser shown with optional wrap-around bumper.

**MODEL 4AT-ST**

## SPECIFICATIONS

Models AT-ST unheated and AT-STH heated, cabinet style, mobile dish dispensers.

**FRAME AND BODY:** The frame is constructed of all welded heavy gauge steel finished with gray baked enamel over rust-resisting undercoat. The body sides are 20 ga. stainless steel and top is 18 ga. stainless steel. Bodies on AT-STH models are insulated on sides and top and lined with zinc coated steel.

**DISPENSERS:** All units are fitted with model AT adjustable drop-in dish dispensers (see catalog page A-1 for specifications). Units are also available for oval platters. (See catalog page A-2, Model ATDO)

**HEATING SYSTEM:** AT-STH models are fitted with a 120 or 208 volt (as specified) single phase, thermostatically controlled heating system complete with a recessed control panel with on-off switch, neon pilot light and adjustable thermostat. The unit is equipped with a 4" long, three wire cord set with NEMA 5-15P plug for 120V or NEMA 6-15P for 208 volt. The unit is Underwriters Laboratories listed.

**CASTERS:** Unit is mounted on four 4" diameter heavy-duty, double ball bearing swivel casters with non-marking rubber tires.

## OPTIONAL ITEMS

- ☐ One piece, wrap-around, non-marking vinyl bumper. (Add 2" to length and width.)
- ☐ 12" vertical bumpers. (Add 1" to length and width.)
- ☐ 5" diameter heavy-duty casters. (Increase height 1".)
- ☐ Casters with polyurethane tires.

**NOTE:** Please circle model number required.

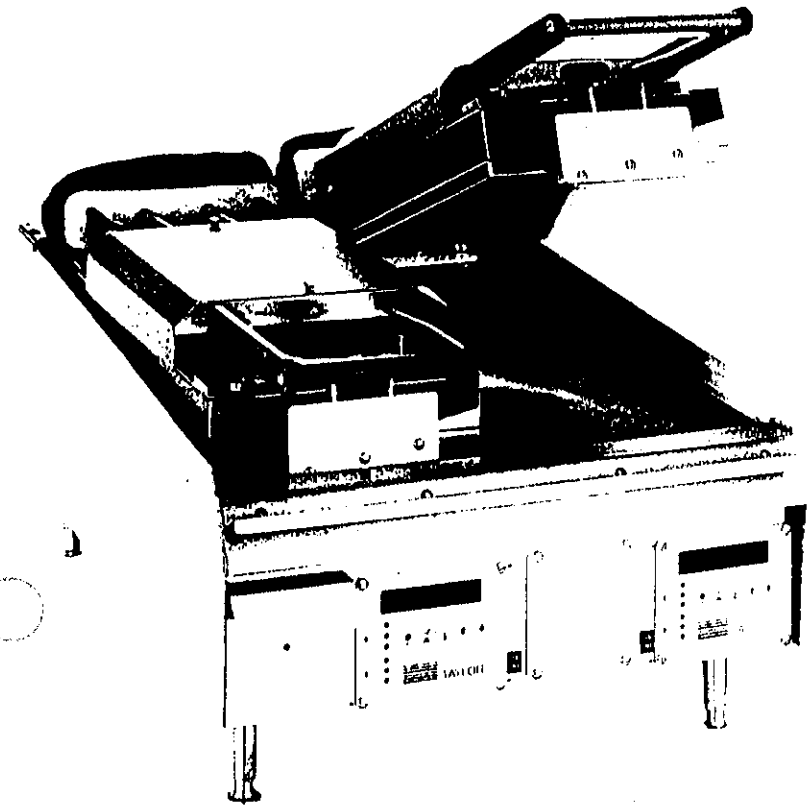
# Model QS24

Single Platen



The Taylor Model QS24, compact, countertop flat or clamshell grill is designed to deliver fresh, cook-to-order menu items...fast! The two sided cooking method is the reliable solution to increase speed of service, reduce product waste, and assure safe product integrity. And when multiple grills are installed side by side, cooking surface and capacities are greatly increased.

This modular design includes two independent 12" (30.5 cm.) wide cooking zones and one or two 11" (27.9 cm.) optional upper platens. The two-sided, contact cooking concept will cook the top and bottom of the product simultaneously. Product will be cooked-to-order and served to the customer in the least amount of time. And the grill responds quickly, returning to preset temperatures every time fresh or frozen foods are added to the grill surface.

Complete your menu with reliable equipment from Taylor...the new QS24, clamshell grill.

## QS (Quick Self) Quiz

Do you want to serve cooked-to-order products FAST? Yes No

Are quick recovery and reliable cooking temperatures, even during your busiest times important to your business? Yes No

Are you concerned that every grilled product served has achieved the proper internal temperature necessary for product safety? Yes No

**If you answered yes to one or more of these questions, the QS24 offers the solution.**

TAYLOR®

e Taylor world-wide distributor network offers the most complete : of equipment, factory trained service technicians, full parts inventory, merchandising programs, financing, and leasing capabilities to meet your needs. Your local distributor is a Taylor professional who can assist in planning your menu.

# Model QS24

## FEATURES

**Cooking Surface**
Two, 12" (30.5 cm.) wide, 24" (61.0 cm.) deep cook areas, 3 independent heating elements for each 12" (30.5 cm.) of cook surface width. Assures even temperatures and quick recovery.

**Control Board**
Programmable microprocessor controls makes menu selection simple and includes a self-diagnostic feature for serviceability.

**Temperature Controls**
Two individual temperature controls can be set from 150°- 425°F (65.5°- 218.3°C). Left and right side operate independently for menus that require items with varied temperatures.

**Indicator Light**
Lights illuminate when heaters are ON.

## OPTIONS

The modular design can be ordered as a flat grill, one upper platen or two. If one upper platen is required, it can be located on either the left or right hand cook surface.

**Upper Platen (optional)**
Each platen has a cooking surface of 11" x 20" (27.9 cm. x 50.8 cm.). Three individually controlled heaters. Platen can be positioned from 30° to a maximum angle of 60° from cooking surface to accommodate various height locations of existing hood.

**Release Material**
Release material completely covers and protects upper platen cooking surface. Attachment ensures that the release material stays in place throughout the day for easy cleaning and will minimize carbon build-up.

## SPECIFICATIONS

**Clearance**
3" (7.6 cm.) from all combustible materials and 3" (7.6 cm.) of air clearance in rear.

**Dimensions**
Width: 24" (60.9 cm.)
Depth: 35-1/2" (90.2 cm.)
Height: 15-1/4" (38.7 cm.) to top of back splash. 20" (50.8 cm.) with optional upper platen lowered.
Counter Clearance: mounted on 4" (10.2 cm.) adjustable legs.

| Electrical | One dedicated connection. | | |

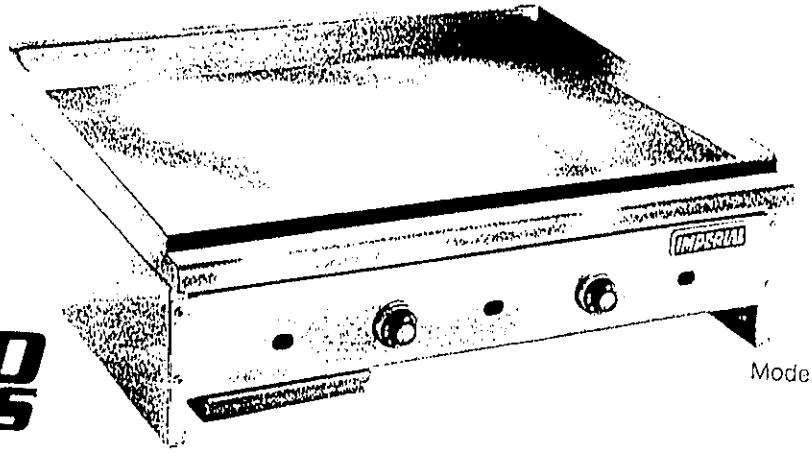
Item # #69e

# Heavy Duty Griddles

## and Open Burner Combinations

## Thermostat Controlled



2000 SERIES

Model # ITG-36

### 2000 Series Standard Features

- NEW Aeration baffles between burners spreads heat across griddle for more even heating.
- NEW Full width rear flue aids uniform heat distribution across griddle plate.
- NEW 4" tapered stainless steel splash guard.
- NEW Open burner combinations have 28,000 BTU/hr. lift-off burners and 12" x 12" cast iron top grates.
- NEW Quad Burner options: (1) Anti-Clogging burner with full flame and a 7,000 BTU low simmer (2) All-Purpose (3) Sauté and (4) Wok Jet.
- 30,000 BTU/hr. "U" type burner located every 12" for even cooking on entire griddle surface.
- Thermostat maintains selected griddle temperature during peak cooking periods.
- Energy saving thermostat is adjustable from 150° to 450°F.
- Each burner has a continuous pilot for instant ignition.
- Stainless steel front, ledge and sides.
- Thick 1" highly polished steel griddle plate maintains temperatures and assures quick recovery.
- Full 24" depth plate for more cooking surface.
- Stainless steel grease trough, one piece rolled front.
- Large capacity, removable grease can.
- 24", 36", 48", 60" and 72" width models available.
- One year parts and labor warranty.
- AGA and CGA design certified, NSF and CE Certified.

### The 2000 Series Heavy Duty Griddles

Imperial provides as standard many of the optional upgrades normally offered at a premium on other Griddle lines. The new look features a stainless steel front, ledge and sides. A new 4" high stainless steel tapered splash guard promotes cleanliness.

Imperial Heavy Duty Griddles with thermostat controls are designed to maintain your selected temperature during peak cooking periods. The 1" thick highly polished griddle plate is ideal for a wide variety of cooking requirements and the 24" depth provides maximum cooking surface. New features have been added to improve uniform temperatures: aeration baffles are located between burners and a full width rear flue. The 30,000 BTU/hr. "U" type burners are strategically located to provide even heating across the entire griddle surface. The high BTU output, total cooking surface and griddle quality assure the best value on the market.

The front stainless steel profile of the griddle is designed to match the IRB Broiler and IHPA Hot Plate series.

NSF CE

ated Dimensions: Height =14" (356) Depth = 33" (838) Width: add 2½" to Griddle width.

**andard Exterior Finish**

**Stainless Steel:** Front, ledge, grease trough, splashguard and sides.

**Control Knobs:** Durable cast metal, polished chrome.

**iddle Top**

**Thermostat Control:** Energy-saving thermostat is adjustable from 150° to 450° F.

**Griddle Burner:** 30,000 BTU/hr. "U" type located every 12" for even cooking. One standing pilot per burner. Aeration baffles between burners and a full width rear flue provide uniform griddle surface temperatures.

**Griddle Plate:** 1" thick, highly polished plate. No breaking-in required. 24" depth. 4" tapered splash guard.

**Grease Trough:** 3" wide grease trough for easy cleaning.

**Open Burner Top:** 28,000 BTU/hr. cast iron burners with lift-off burner heads. No gaskets, no screws. Four Interchangeable burner heads available: Anti-Clogging is standard, All-Purpose, Sauté and Wok Jet are optional. One standing pilot for each burner for instant ignition.

**Burner Top Grates:** 12" x 12" lift-off sections, heavy duty cast iron. Cast-in bowl directs heat upward. Grate features anti-clogging pilot shield.

### Optional Items

Open burners; one thermostat per burner; and manually controlled gas valves. Open burner options: All Purpose, Sauté or Wok Jet burner head. Extra capacity grease cans; quick disconnect and flexible gas hose; set of 4" legs; stainless steel stands; and casters (front two casters are locking).

### Gas

Manifold pressure is 5.0" W.C. for natural gas or 10.0" for propane gas. Manifold size ¾" NPT. Specify type of gas and elevation if over 2,000 ft.

### Clearance

For use only on non-combustible surfaces. Provide 0" clearance from non-combustible surfaces and 8" from combustible walls at sides and 7" from rear walls.

AVTEC

### APPLICATION DATA

For use over all types of cooking equipment; unique grease extractor has auto wash and internal fire protection and extracts up to 95% of grease contaminants. Canopies are generally installed 6'-6" above finished floor. Stainless steel enclosure panels to the ceiling are available, or the hood may be recessed into the non-combustible false ceiling, depending on type of air make up - contact factory.

### SUPPLY AIR MAKE-UP

☐TYPE " P" LOW VELOCITY FRONT DISCHARGE SUPPLY

Integral supply make-up air normally sized at 80% of exhaust volume, remaining 20% from adjacent areas to contain odors within the kitchen. Normally air is heated to 55°-65°F. Consult factory for specifics.

The perforated front panel slows the supply air velocity to lessen the effect of partially tempered outside air on conditioned room air. When lowest velocity is desired, the 30" high plenum [ventilator] is recommended.

☐ TYPE "I" INTEGRAL "SHORT CYCLE" SUPPLY

The integral "short cycle" supply air plenum may be used with up to 70% untempered air per U.L. testing. Some local codes limit this percentage or do not allow the "short cycle" concept. Normally, this type hood is used in warmer climates not susceptible to the colder, higher density winter air.

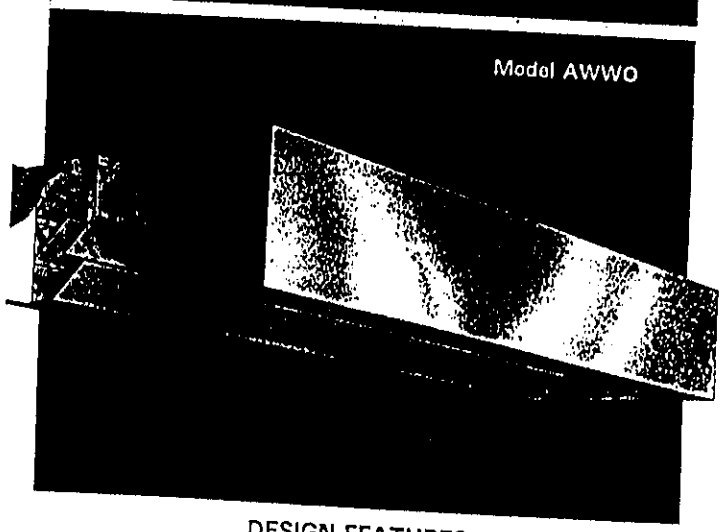
Integral untempered supply make-up air varies according to exhaust requirements, 20% recommended from adjacent areas to contain odors within the kitchen and remaining amount from ceiling registers located ideally 20 ft. from the hood. Consult factory for specifics.

☐TYPE "E" EXTERNAL FRONT GRILL SUPPLY

Same air volumes as "P" type. Recommended for installations where finished ceiling is less than 9 ft. prohibiting effective use of "P" type [above]. The 4-way diffusers and internal balancing dampers allow precise directional control. Generally, air is conditioned to room temperature and directed just below the ceiling.

☐TYPE "D" DUAL EXTERNAL AND INTERNAL SUPPLY

Integral supply make-up air normally sized at 80% of exhaust volume, remaining 20% from adjacent areas to contain odors within the kitchen. A combination of "I" and "E" type, allows for fine tuning of short cycle air supply. Varying climates may require incoming air to be conditioned to room temperature.



### DESIGN FEATURES

- U.L. Listed. Complies with all national codes.
- Auto wash and internal fire protection system.
- Unique extractors remove up to 95% of grease contaminants.
- Integral supply air balancing and fire damper.
- Electromechanical, resettable exhaust fire damper.

### OPTIONS AND ACCESSORIES

- U.L. Listed fusible link exhaust fire damper.
- Stainless Steel enclosure panels to ceiling.
- Auto Wash Control Panel with:
  - √ Fan and/or light switch
  - √ Fire System Interface
  - √ H.O.A. Fan Starter Interface
- Integral fire suppression system enclosure.
- Wet chemical fire suppression system.
- Water mist fire protection system with gas reset.
- Fan motor controller package
- Exhaust & supply fan package

### EXHAUST AIR RECOMMENDATIONS

For cfm, static pressure and duct collar sizes other than above, see Air Flow Requirements form no. 14012. Air speeds vary according to duct collar size; average speeds are 1800 fpm exhaust and 1000 fpm supply

Use above chart for supply air types "P", "E" & "D"; 80% supply air volume shown, 20% from adjacent areas to contain cooking odors within kitchen.

Do not use above chart for untempered short cycle supply type "I"; this should be sized at 40% to 70% of exhaust cfm, 20% from adjacent areas to contain odors, remaining amount from ceiling registers approximately 20 ft. from hood - contact factory.

# AUTO WASH VENTILATOR CONTROL PANEL

Model VCWW

AVTEC

U.S. Patent # 4,156,432

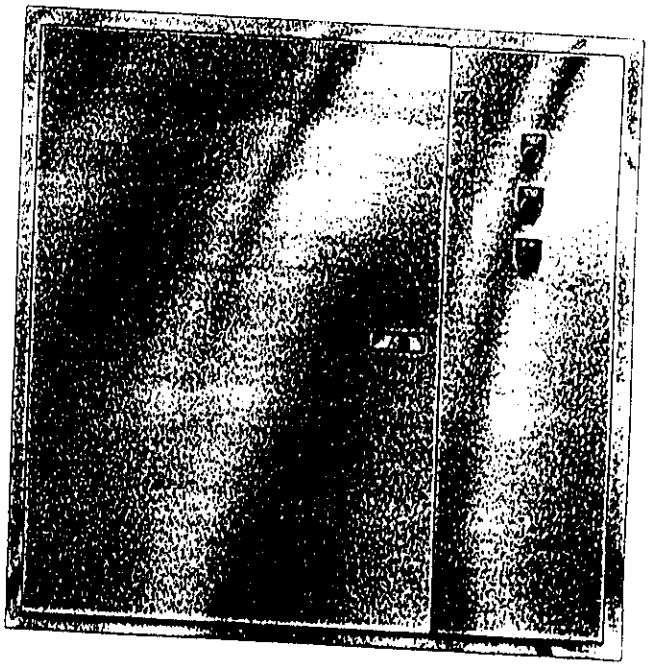
*ECONOMY CONTROL . . WITH AVTEC*

## APPLICATION DATA

The AVTEC Auto Wash Ventilator Control Panel is supplied with the AVTEC Auto Wash Ventilator. The cabinet houses the electrical and plumbing components necessary to control the exhaust [and air make-up] fan(s), auto wash self-cleaning cycle and plenum fire protection system.

One panel will control one or more fans if operated simultaneously. Each panel will operate up to 50 linear feet of ventilator with a single wash [0-10] minutes]; for over 50 feet, use two or more panels. If hot water and low pressure is limited and sequential washes are desired, we recommend the AVTEC "PAWS" Control Panel.

An electric thermal detector fire switch is mounted in the duct collar and automatically activates the plenum fire protection [spray], closes the adjacent fire damper and turns off the fan. An optional flush mounted or remote manual pull fire switch is available to activate the plenum fire protection [spray] and exhaust fan [to remove fumes]. Surface cooking fire protection should be specified with this system. AVTEC'S MIST-A-FIRE System is recommended if a building sprinkler system is available; the control panel for this system may be combined with the AVTEC "PAWS" Control Panel.



## DESIGN FEATURES

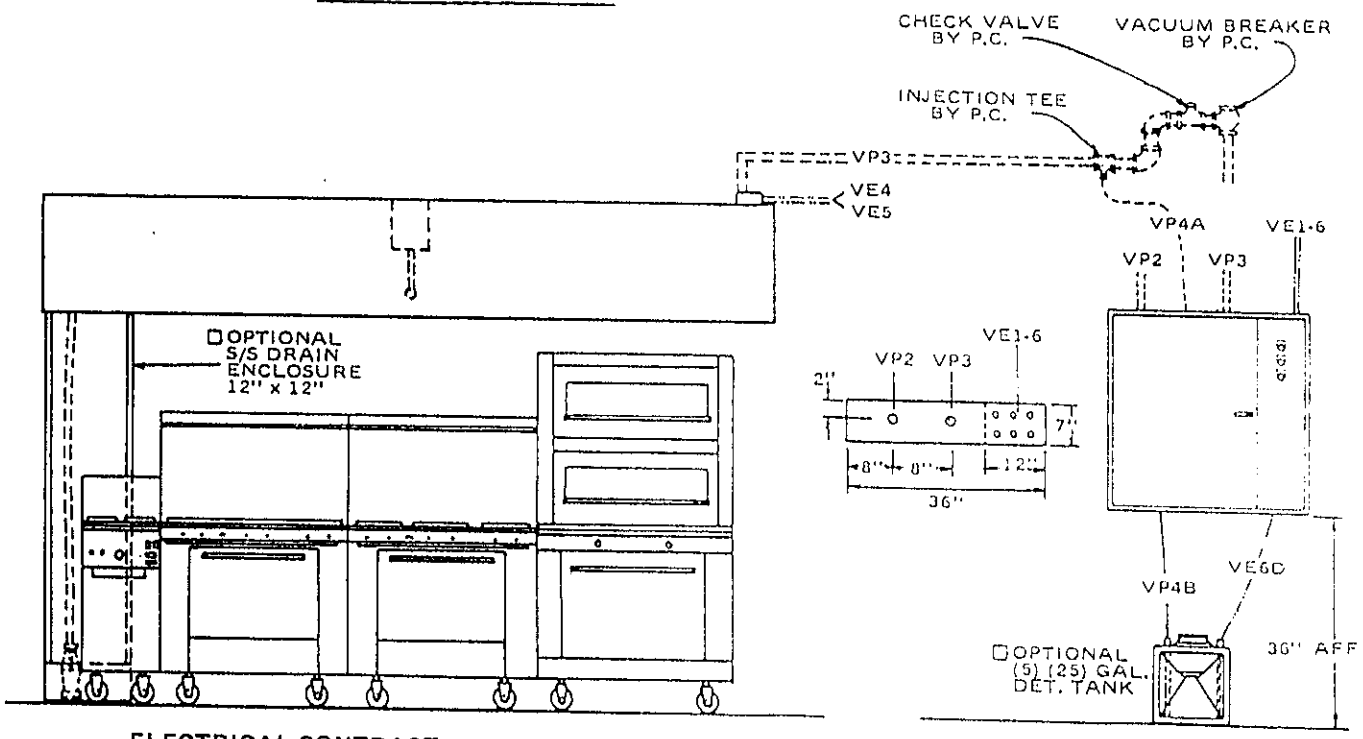
UL NSF

- Automatic Wash System shuts OFF fan and injects detergent and hot water into grease extractor chamber for up to ten minutes
- Optional Manual Fire Switch initiates fire quenching spray in plenum and activates fan to remove toxic fumes.
- Automatic Thermal Fire Detector initiates fire quenching spray in plenum, closes the damper to prevent fire from spreading to the ductwork and deactivates the fan.
- Optional Vent Light Switch may be conveniently mounted on control panel.
- Optional Low Level Detergent Alarm

AVTEC INDUSTRIES INC. 120 KENDALL POINT DR. OSWEGO, IL 60543 [630] 851-4800

VENT. CONTROL MODEL # VCWW PROJECT:_____ITEM#_____

## SERVICE CONNECTIONS



## ELECTRICAL CONTRACT

### BUILDING SERVICES

VE1 ☐ 20A 120/1 control power supply
VE2 ☐ 20A 120/1 power supply for vent lights.

### FIELD INTERCONNECTIONS

VE3 ☐ 120/1 control circuit to fan magnetic motor controller, for exhaust (& supply) fan(s)
VE4 ☐ 20A 120/1 power from AVTEC panel to vent lights.
VE5 ☐ 120/1 to thermo detector damper box.
VE6 ☐ Provide (2W) field interconnects to (remote only)
- A ☐ Manual Pull Fire Switch
- B ☐ Wash Solenoid Valve 120 volt
- C ☐ Detergent Pump 120 volt
- D ☐ Detergent Sensor Probe 20vdc

CONTROL CABINET SIZE
Standard: 36" x 36" x 7" d
5 Gal. Det. Tank: 36" x 36" x 10" d
Cold Water Mist: 42" x 42" x 7" d
1¼" mounting flange for recessed option.
Add ½" all sides for wall opening.
Weight: 220 lbs. crated

PLUMBING DATA - LENGTH/SIDE

| LENGTH | H.W. INLET |
|---|---|
| 0 - 15' | ¾" |
| 16' - 24' | 1" |
| 25' - 50' | 1¼" |
| over 50' | ** |

** Use multi-wash. Contact factory.

H.W. Flow Rate=1.2 GPM/ft. @25 psi (140°F for 3-5 min.)

## PLUMBING CONTRACT

### BUILDING SERVICES

VP2 ☐ ____" hot water (140°F) to control panel (20 to 40 psi)

### FIELD INTERCONNECTIONS

VP3 ☐ ____" hot water (140°F) to ventilator ____ places.
VP4 ☐ 3/8" Detergent tubing
- A ☐ From detergent pump to injection tee.
- B ☐ Inserted in remote detergent tank.

### OPTIONAL

VP7 ☐ 3/4" cold water to control panel.
VP8 ☐ 3/4" cold water to vent ____ places.

NOTE: Other required connections are shown on Ventilator Rough-In Data Sheet.

**IMPORTANT NOTE: The various trades' installation responsibilities must be included in their contracts.**

## SPECIFICATIONS

Provide AVTEC U.L. Listed, NSF approved, (surface) (recessed) wall mounted Auto Wash Ventilator Control Panel, Model No. VCWW to operate AVTEC ventilator fan(s), wash cycle and internal plenum and duct collar fire protection system. Control panel to be 18 gage stainless steel and shall house all electrical and plumbing components.

Electrical components to consist of FAN START, FAN STOP/WASH START & RESET buttons, adjustable auto wash timer, 0 to 10 minutes, detergent pump prime switch, and thermal detector switch. RESET button to interrupt FAN ON or WASH ON modes.

Plumbing components to consist of ball type shut off valve, wye-strainer, pressure-temperature gage, shock absorber, solenoid valve, detergent pump and 2 gallon reservoir.

All components to be pre-wired and pre-plumbed ready for field connection by applicable trades.

### ACCESSORIES

☐ Provide illuminated STOP/START buttons.
☐ Provide (panel mounted) & (remote) manual pull fire switch.
☐ Provide vent light switch.
☐ Provide (integral 5 gal.) (remote 5 gal.) (remote 25 gal.) detergent tank (and pump).
☐ Low Level Detergent Indicator with Audio Alarm

### OPTIONAL

☐ Provide micro-switch in lieu of thermal detector to operate fan and wash spray in fire condition, upon signal from fusible link damper.

## Supremacy Series™ Solid/Glass Heated Roll-In

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Glass doors shall be constructed with extruded aluminum frames. Refrigerator shall utilize insulated double-pane construction. Freezers shall utilize argon-insulated double-pane, low E construction. Glass doors shall be provided with self-closing, cam-lift style hinges, and shall be easily removable without the use of tools. Glass door cabinets shall be provided with high-output fluorescent lights.

Electronic controls shall be located behind a removable shroud facing. Main power switch shall be located on the junction box on top of the unit.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.

**OPTIONS & ACCESSORIES**

Stainless steel backs
Laminate on doors & ends
Tray Slides
Kick panels
Remote refrigeration
Correctional Facilities package

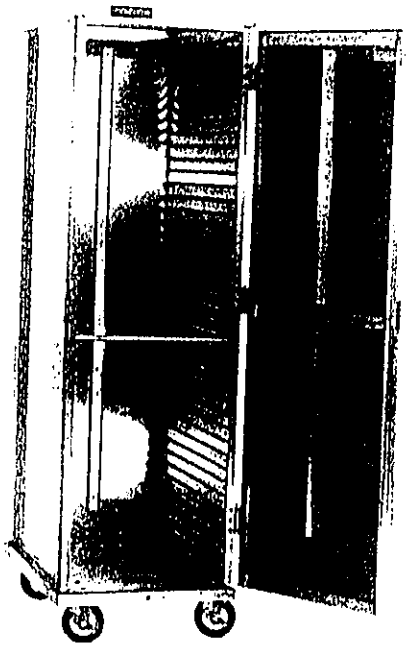
# NON-INSULATED EXTRUDED SIDEWALL UTILITY CABINETS 150 SERIES

## FEATURES AND BENEFITS:

- Non-insulated all purpose cabinet for transport and storage.
- Same size top and base extend past sidewalls to act as natural bumpers for protection. Extruded frame fully welded.
- Body constructed of non-corrosive, Hi-Tensile aluminum for strength and ease of mobility.
- Reinforced, full length door swings 270° and can be latched to the cabinet side for convenience. Card clip included.
- Gravity type latch secures door during transport.
- Interlocking extruded sidewalls hold 18" x 26" pans and plastic food boxes on 1-1/2" centers. Easy to clean.
- Interior pan stops on door and back allow proper air flow.
- Heavy duty 5" swivel casters, two with brakes. Provides mobility when fully loaded.



150-1840C

NSF

ACCESSORIES and OPTIONS (Available at extra cost):

- ☐ Lock Hasp
- ☐ Various Caster Options
- ☐ Corner Bumpers
- ☐ Perimeter Bumper
- ☐ Floor Lock (for use with 5" casters)
- ☐ Plexiglas Door
- ☐ Push Handle
- ☐ Bail Handle Kit
- ☐ Left-Hand Hinged Door
- ☐ Kold Keepers

See page A-20 for accessory details.

Vhen ordering bumpers, add 2" to overall dimensions.

.LL ALUMINUM CONSTRUCTION IS RIVETED, WELDED AND FINISHED.

## :ABINET:

Posts: Extruded channels, 7/8 x 2-1/4 x .102, welded to top and base, form a solid frame.

Sides: Interlocking extruded 6" panels, smooth outer sides.

Back panel: Fitted into posts, riveted to top and reinforced.

Tie rod: Applied at front.

Top: One piece .100 aluminum.

Pan stop channels: Mounted to inside rear of cabinet and door.

## ASE:

One piece construction, .190 aluminum.

Casters: 5" dia., swivel, neoprene tires, 1-1/4 wide, load cap. 200 lbs. each, temp. range -20°/+160°F. Bearings are sealed and permanently lubricated. Front casters equipped with brakes.

## OOR:

Panel: .063 brushed aluminum, fitted into door stile extrusions, 3/4 x 1-7/16 x .187.

Reinforcement: 1/4 x 1-1/2 extruded bars riveted and welded horizontally to top, center and bottom.

Latch: Gravity type, nickel plated steel.

Swings 270° on 3 butt hinges, riveted to posts and stiles.

## PAN SLIDES:

- Extruded interlocking side walls act as pan slides on 1-1/2" centers.

## SHORT FORM SPECIFICATIONS

Cres-Cor Utility Cabinet Model 150-18____C. Formed and welded .100 aluminum top, .190 aluminum base. Interlocking extruded aluminum sidewalls for (___) 18" x 26" pans and plastic food boxes on 1-1/2" centers. Brushed .063 aluminum door, full frame welded construction. 5" swivel neoprene casters, permanently lubricated, sealed ball bearings. Load capacity 200 lbs. each. Provide the following accessories: ____ ____ ____. NSF listed. 2 year parts warranty.

THE GALLEY PORTAFROST – Ideal for self-service foods that must refrigerated at a constant 33°F. Used for salads, cold desserts, milk shakes, cold cuts, cheeses, spreads, juices, fresh fruits and melons. Ten-inch deep cold pan provides a 3" cold blanket which keeps the hot air out and foods between 33°F and 40°F.

- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.
- Aesthetic design, three neutral colors, dove white, pewter tan or black pearl, blends in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.

To be ***Galley® Line*** 10" Deep Refrigerated Cold Pan Unit, Model _____ with accessories as specified.

**GENERAL:** Unit to be self-contained, stainless steel, mobile self-service 10" deep Refrigerated Cold Pan module for refrigerator temperature foods. Body material to be one of three neutral base colors, dove white, pewter tan or black pearl. "Matelock" self-lock- and aligning end panels allow modules to be interconnected. To e recessed push handles at each end. Side skirts to be remov- for access to compressor and controls. Side skirts to be sed to accept decorator panels. Server's side to be open to ccept accessories. To be listed by National Sanitation Foundation.

**CONSTRUCTION:** Body material to be of flame retardant ABS formed plastic fastened to galvaneal under-carriage. 14 ga. 300 series stainless steel top to have not less than #4 finish. Optional Buffet canopy contains fluorescent light. One-piece acrylic breath-guard is removable. Canopy is supported by stainless steel uprights and covered with flame retardant ABS formed plastic. To have removable white low-gloss-ABS plastic drain base. Cold pan drain to include hose and shut-off. Insulated cold pan to be constructed of 300 series stainless steel and shall be 10" deep. The pans are to be set on a ledge 3" below the top surface and surrounded with frost. The cold pan refrigeration system to be a 1/4 h.p. hermetically sealed condensing unit. Condensing unit to be fully enclosed in a corrosion resistant ventilated housing. Plate mounted 4" diameter swivel casters with toe brakes to be provided. Power supply cord to be 6 feet in length. NEMA plug configuration to be 5-15P. To be used with a branch circuit rating of 15 amps, single pole. Power supply cord to be 14 AWG, 3 conductors.

## Supremacy Series™ Solid Door Roll-In Refrigerators and Freezers

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Glass doors shall be constructed with extruded aluminum frames. Refrigerator shall utilize insulated double-pane construction. Freezers shall utilize argon-insulated double-pane, low E construction. Glass doors shall be provided with self-closing, cam-lift style hinges, and shall be easily removable without the use of tools. Glass door cabinets shall be provided with high-output fluorescent lights.

Electronic controls shall be located behind a removable shroud facing. Main power switch shall be located on the junction box on top of the unit.

**THE FOLLOWING APPLIES TO REFRIGERATORS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall be coated to prevent corrosion. Cabinet shall maintain 34°F to 40°F (1°C to 4°C) internal temperature.

**THE FOLLOWING APPLIES TO FREEZERS ONLY**

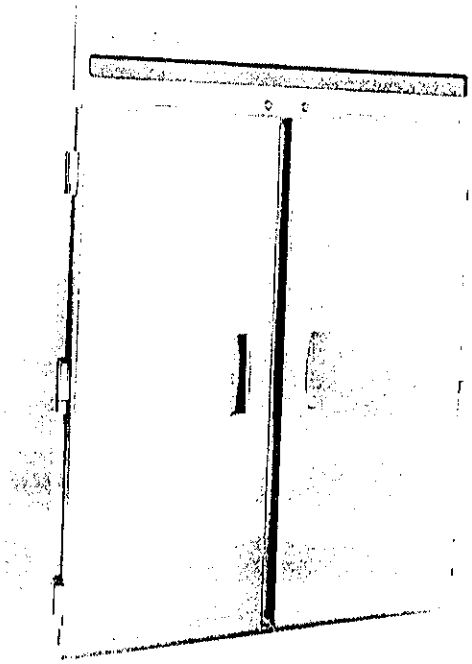
Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall have deep-corrugated, staged fin construction for maximum efficiency with fewer defrost cycles. Cabinet shall maintain –10°F to 0°F (-23°C to -18°C) internal temperature.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.



MODEL SRRI2-S

**OPTIONS & ACCESSORIES**

Stainless steel backs
Laminate on doors & ends
Tray Slides
Kick panels
Remote refrigeration
Correctional Facilities package
ERC-2 microprocessor - based controls

***NOTES:***

*Bottom to be reinforced with 14 gauge castor channels. All units to be supplied with easily – attachable 16 gauge stainless steel ramps, 1 per door opening. Wiper gasket shall be provided on bottom of door for seal to ramp. Units shall have a removable 14.0" (35.6cm) "sleeper" section to facilitate installation; an optional 20.0" (50.8cm) "sleeper" section shall be available.*

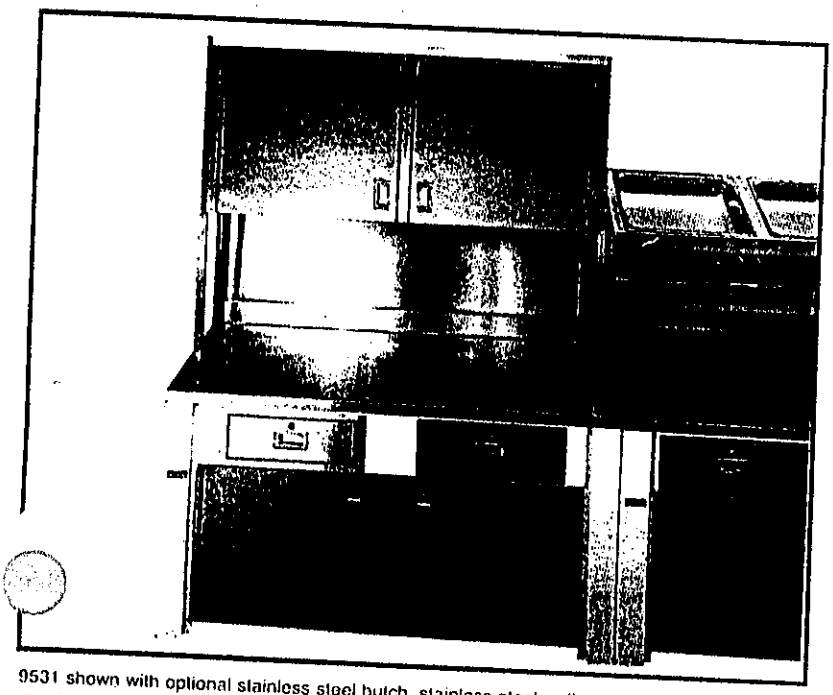
A1A11420



9531 shown with optional stainless steel hutch, stainless steel wall guard, stainless steel back splash, and flat ends.

- Aesthetic design, three neutral colors, dove white, pewter tan, or black pearl blend in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.
- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.

## 31.5" (80cm) Deep Self-Contained Refrigerated Salad Top Tables

### Short Form Specifications

**Exterior top** is constructed of one-piece 16-gauge stainless steel, with integral 2.12" (5.4cm) square nosing at the front, and 4.00" (10.2cm) high by 2" (5.1cm) deep backsplash at the rear. Top has an opening for use with 1/6 size pans. Pans and adapter bars supplied by others. Pans are recessed 3" (7.6cm), or 2" (5.1cm) and rest on adjustable pan supports. Pan opening has a 20-gauge stainless steel removable cover. Temperature in top opening to maintain 33°F (1°C) to 41°F (5°C), with pans recessed 3" (7.6cm), at 86°F ambient room temperature, meeting NSF7 requirements.

Unit has a stainless steel plate shelf 8.4" [21.3cm] above the doors.

**Exterior back** and bottom to be 24-gauge galvanized steel. Exterior ends are 18-gauge galvanized steel.

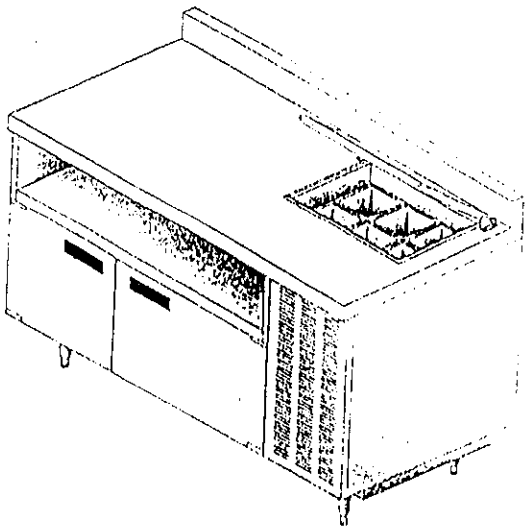
**Base interior** has a 22-gauge stainless steel back and bottom. Interior ends and door frames are thermoformed ABS plastic. Base is insulated with 1.5" (3.8cm) of high-density foamed-in-place polyurethane.

**Door(s)** have a 22-gauge stainless steel exterior front, with a thermoformed ABS plastic interior liner. Door(s) have a black recessed handle and a snap-in magnetic gasket which is easily replaceable.

**Base** has a machine compartment, standard on the right, with condensing unit, condensate evaporator and an electrical junction box installed. Machine compartment has a louver for access to condensing unit. Blower coil(s) are mounted behind the door mullions and refrigerate the cabinet. HFC-404A refrigerant and maintains 36°F (2°C) to 40°F (4°C) interior cabinet temperature in the base.

Unit is mounted on 6.13" (15.6cm) high adjustable stainless steel legs.

**Electrical connections** are 115 volts, 60 Hertz, single phase. Unit has an 8' (2.4m) long cord and plug.



**Model F18SC60A**

## Supremacy Series™ Solid Door Reach-In Refrigerators and Freezers

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments. Units mounted on 4" (10.16) casters.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Glass doors shall be constructed with extruded aluminum frames. Refrigerator shall utilize insulated double-pane construction. Freezers shall utilize argon-insulated double-pane, low E construction. Glass doors shall be provided with self-closing, cam-lift style hinges, and shall be easily removable without the use of tools. Glass door cabinets shall be provided with high-output fluorescent lights.

Electronic controls shall be located behind a removable shroud facing. Main power switch shall be located on the junction box on top of the unit.

**THE FOLLOWING APPLIES TO REFRIGERATORS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall be coated to prevent corrosion. Cabinet shall maintain 34°F to 40°F (1°C to 4°C) internal temperature.

**THE FOLLOWING APPLIES TO FREEZERS ONLY**

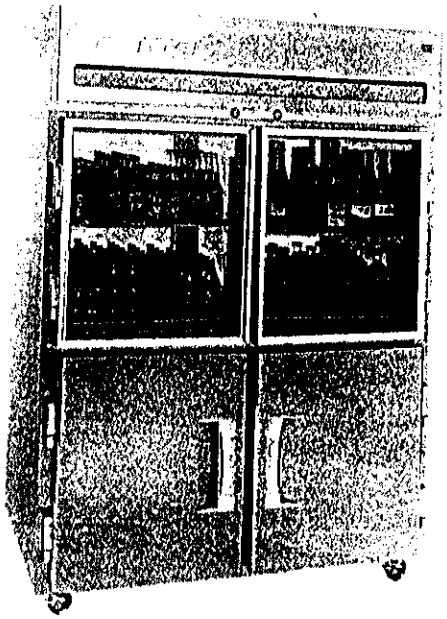
Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall have deep-corrugated, staged fin construction for maximum efficiency with fewer defrost cycles. Cabinet shall maintain –10°F to 0°F (-23°C to -18°C) internal temperature.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.



MODEL SRR1-GHSH

**OPTIONS & ACCESSORIES**

- Stainless steel backs
- Laminate on doors & ends
- Additional shelves and bridges
- Tray Slides
- Kick panels
- Half-size hinged glass or stainless steel doors, two doors per section
- Remote refrigeration
- Correctional Facilities package
- ERC-2 microprocessor - based controls
- 6" (15.24 cm) diameter legs (adds 2" to over height of unit)

# Ranserve SCA Series Cold Pan Units

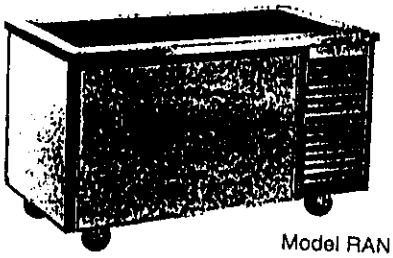
RanServe By Randell

PROJECT #89

ITEM # QTY.

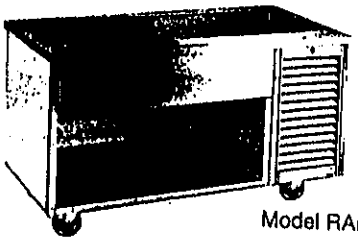
DATE

## Self-Contained Cold Pan Units



Model RAN SCA-3

Portable, stainless steel self-contained cold pan serving station. 1" drain provided. Available with enclosed base or open storage. Foamed in place (CFC free) insulation. Interchangeable stainless steel, or laminate body panels, snap together locking device designed to work with all other Ranserve equipment. (4) swivel casters provided. R-404a wrapped refrigeration system is "CFC free", and meets NSF standard #7.



Model RAN SCA-3S

## Models ☐ SCA Series ☑ SCA "S" Series

### STANDARD FEATURES:

- Stainless steel self-contained cold pan with expansion valve, temperature control and one piece interior.
- HFC-404a refrigerant, "CFC free".
- Foamed in place (CFC free) high density polyurethane insulation.
- Interchangeable body panels.
- "Bayonet" locking system to align and hold unit together with other Ranserve units if needed.
- 1" drain, drain nipple and ball valve.
- Swivel casters - (2) locking.
- Meets NSF standard #7.

MODELS
RAN SCA-3
RAN SCA-4
RAN SCA-5

RAN SCA-3S
RAN SCA-4S
RAN SCA-5S

### SPECIFICATIONS:

**UNIT TOP:** Top to be one piece of die-formed 16 gauge stainless steel with 1 1/2", 90° nosing on all sides. Unit fitted with 9 1/2" deep self-contained display cold pan. Interior of pan to be one piece, continuously welded construction of 18 gauge stainless steel. Interior fitted with 1" drain at one end. Drain nipple supplied with ball valve and lever extension to cabinet exterior on enclosed base units - drain lines run to accessible area.

**UNIT BODY:** SCA Series (Buffet style with ***enclosed base***); One end of unit to be fitted with female, spring loaded openings and the other end to be fitted with male " bayonet" fittings to align, and hold units in place when two or more modular units are joined. Body frame to be all welded construction of steel with exposed corners to be 1 1/2" stainless steel. All corners welded and polished. Body ends and panels to be plastic laminate with galvanized steel backing (specify laminate color). Body ends and panels to be removable to allow the changing of colors. Cold pan wrapped with refrigeration lines and insulated with high density (CFC free) polyurethane, foamed in place. Unit to be equipped with 4 swivel casters, (2) locking, that are recessed inside of toe area.

**REFRIGERATION:** CFC free, R-134a refrigeration system to be wrapped refrigeration construction. Expansion valve, and thermostatic control for operator adjustability mounted in compressor housing. 9' cordset (NEMA 5-15P) supplied for 120V operation.

**"S" series** (Cafeteria style with ***open base***) Same spec as SCA series only "S" series units to have partial stainless steel panel on one side with undershelf. Undershelf to be 22 gauge stainless steel with integrally welded steel under-bracing. Self-contained display pan to have ball valve, accessible thru storage area.

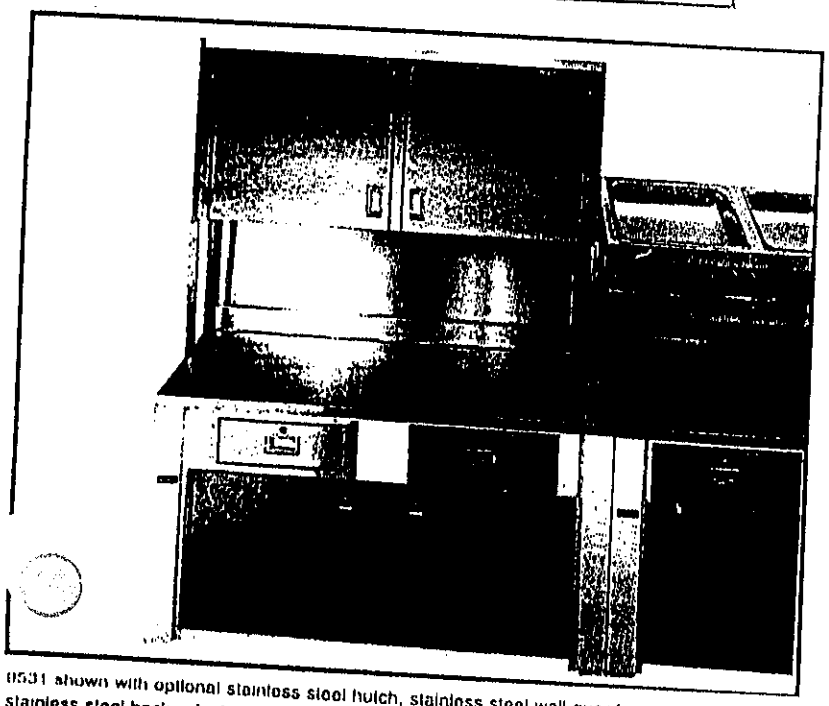
Model No. 9540
Model No. 9541
Model No. 9550
Model No. 9551

A1A11420



9531 shown with optional stainless steel hutch, stainless steel wall guard, stainless steel back splash, and flat ends.

- Aesthetic design, three neutral colors, dove white, pewter tan, or black pearl blend in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.
- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.

ACCESSORIES:

A. Decorator panels, specify catalog number and quantity. (See chart on front side).
- ☐ Catalog No. 8700 American Walnut, Quantity_____ Included.
- ☐ Catalog No. 8701 Teakwood, Quantity_____.
- ☐ Catalog No. 8702 Plain Custom Panel, Quantity_____.
- ☐ Catalog No. 8705A Light Oak, Quantity_____.

B. Folding Trayslides. All stainless steel with die-stamped three-rib reinforcement.
- ☐ Catalog No. 8771, (*Short 28") 20⅞" width, used on 9310.
- ☐ Catalog No. 8772, 28" width, used on 9310.
- ☐ Catalog No. 8773, (*Short 50") 42⅞" width, used on 9330.
- ☐ Catalog No. 8774, 50" width, used on 9330.
- ☐ Catalog No. 8775, (*Short 64½") 57⅞" width, used on 9340.
- ☐ Catalog No. 8776, 64½" width, used on 9340.1
- ☐ Catalog No. 8777, (*Short 79") 71⅞" width, used on 9350.
- ☐ Catalog No. 8778, 79" width, used on 9350.

*Note: A short trayslide must be used on the first module to the right of Corner In-Fill Module for inside turns.

C. Food Protector with plastic shell, breathguard and stainless steel upright supports. 14" high.
- ☐ Catalog No. 8780, 50" width, used on 9330. Unlighted.
- ☐ Catalog No. 8791, 50" width, used on 9330. Lighted. UL listed.
- ☐ Catalog No. 8781, 64½" width, used on 9340. Unlighted.
- ☐ Catalog No. 8792, 64½" width, used on 9340. Lighted. UL listed.
- ☐ Catalog No. 8782, 79" width, used on 9350. Unlighted.
- ☐ Catalog No. 8793, 79" width, used on 9350. Lighted. UL listed.

D. Double Deck Display Stand with two plastic shelves, breathguard and stainless steel upright supports. 18" high.
- ☐ Catalog No. 8785, 50" width, used on 9330. Unlighted.
- ☐ Catalog No. 8788, 50" width, used on 9330. Lighted. UL listed.
- ☐ Catalog No. 8786, 64½" width, used on 9340. Unlighted.
- ☐ Catalog No. 8789, 64½" width, used on 9340. Lighted. UL listed.
- ☐ Catalog No. 8787, 79" width, used on 9350. Unlighted.
- ☐ Catalog No. 8790, 79" width, used on 9350. Lighted. UL listed.

E. Folding Cutting Board. All plastic. Mounted flush on server's side. Not available on Model 9310.
- ☐ Catalog No. 8763, 50" width, used on 9330.
- ☐ Catalog No. 8764, 64½" width, used on 9340.
- ☐ Catalog No. 8765, 79" width, used on 9350.

F. "Mateflat" Panel. (Makes any Galley unit compatible with any other serving line equipment or for squaring unit to wall.) Size 5⅞"W x 28"D x 36"H.
- ☐ Catalog No. 8761 Male Panel (Fits female end).
- ☐ Catalog No. 8762 Female Panel (Fits male end).

G. Heated Shelf.
- ☐ Catalog No. 8726, use with 50" unit.

H. Flat End Panel. (Makes any Galley unit compatible with any other serving line equipment or for squaring to wall.)
- ☐ Catalog No. 8731, Replaces female "matelock".
- ☐ Catalog No. 8732, Replaces male "matelock".

I. Urn Drain. Not on models with drawers.
- ☐ Catalog No. 8715, 18" long.
- ☐ Catalog No. 8716, 24" long.
- ☐ Catalog No. 8717, 30" long.
- ☐ Catalog No. 8718, 36" long.

Drain trough with drain hose and valve to be located on customer's side.

J. Merchandising Shelf.
- ☐ Catalog No. 8722, use with 50" width unit.
- ☐ Catalog No. 8713, use with 64½" width unit.
- ☐ Catalog No. 8714, use with 79" width unit.

K. Portable Breathguard.
- ☐ Catalog No. 8724.

L. Buffet Style Canopy.
- ☐ Catalog No. 8740, use with 50" unit. UL listed.
- ☐ Catalog No. 8741, use with 64½" unit. UL listed.
- ☐ Catalog No. 8742, use with 79" unit. UL listed

M. Low End Shelf.
- ☐ Catalog No. 8725. (Not for use with item I or M)

N. Buffet Style Canopy with Heat Lamps.
- ☐ Catalog No. 8743, use with 50" width unit. UL listed
- ☐ Catalog No. 8744, use with 64½" width unit. UL listed
- ☐ Catalog No. 8745, use with 79" width unit. UL listed.

O. Electrical Outlets (Not UL listed).
- ☐ Catalog No. 8696, Tombstone, Top Mounted, Duplex, 125V, 15 AMP
- ☐ Catalog No. 8697, Operator Side, Under Top Skirt, Duplex,120V,16 A
- ☐ Catalog No. 8698, Operator Side, Under Top Skirt, Single, 120V,15 A
- ☐ Catalog No. 8699, Operator Side, Under Top Skirt, Single, 120V, 15 AMP

Note: #8696 and #8697 are part of the module wiring. #8698 and #8699 have separate cord set.

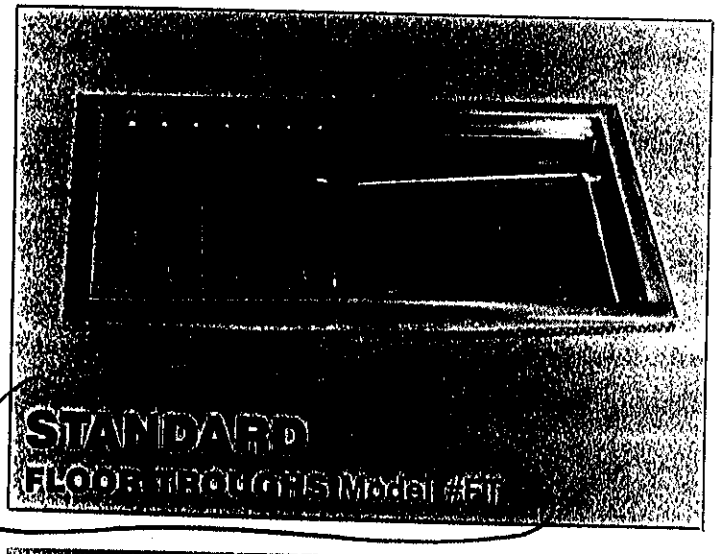
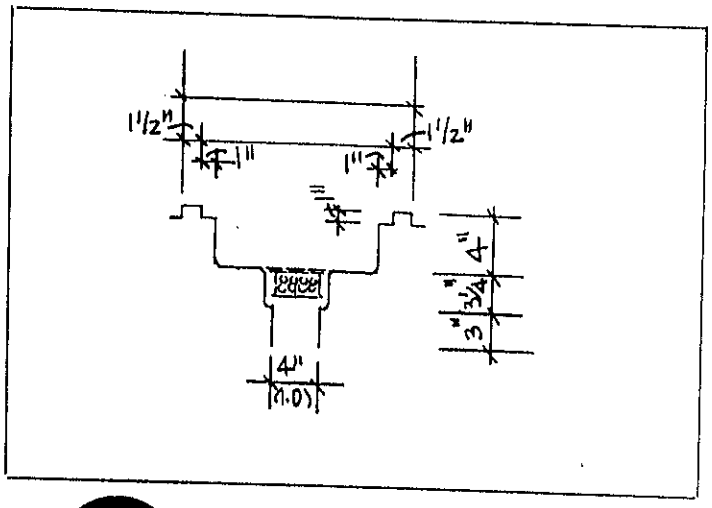
ITEM #91

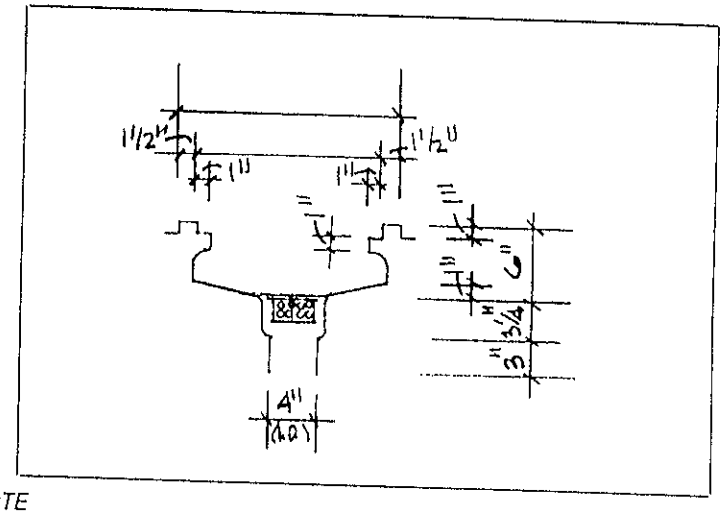
# STANDARD DEPTH FLOOR TROUGHS



## CONSTRUCTION

All floor troughs are constructed of heavy duty gauge stainless steel type 304- 18-8, completely welded and coved. All welds are ground & polished smooth. Troughs have built-in pitch towards wastes for complete drainage and anchor straps for securing. All troughs are fitted with special stainless steel waste cup with removable perforated stainless steel basket to accommodate up to 3" waste pipe. Advise size and location of waste outlet.





*NOTE*

*For troughs less than 15" wide 1½" top edge will become ¾".*

# GRATING FOR STANDARD TROUGHS

## SUBWAY GRATING /Model #SG

(All Type 304 Stainless Steel)

Grating to be constructed of 3/16″ x 1″ bars, set in a vertical position with open front and back for ease of draining.

Two (2) 1/2″ rods, set 3″ in from each edge, are wedged thru the bars full length. Three (3) 1/2″ rods are used for grating over 15″ wide.

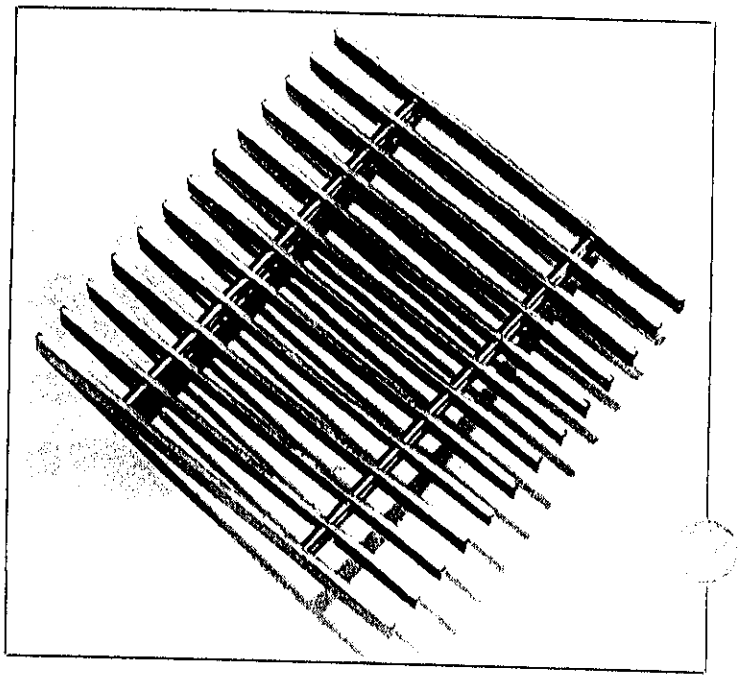
Rods are Heli Arc welded to each 3/16″ bar for rigidity thereby eliminating swaying and crevices.

There is 13/16″ clearance between bars so that wheels of mobile equipment will not become wedged.

Length of gratings are kept at maximum of 20″, for ease of handling and for cleaning in dishwasher.

(Longer lengths available upon request.)

(Bars can be had at any desired centers, specify)



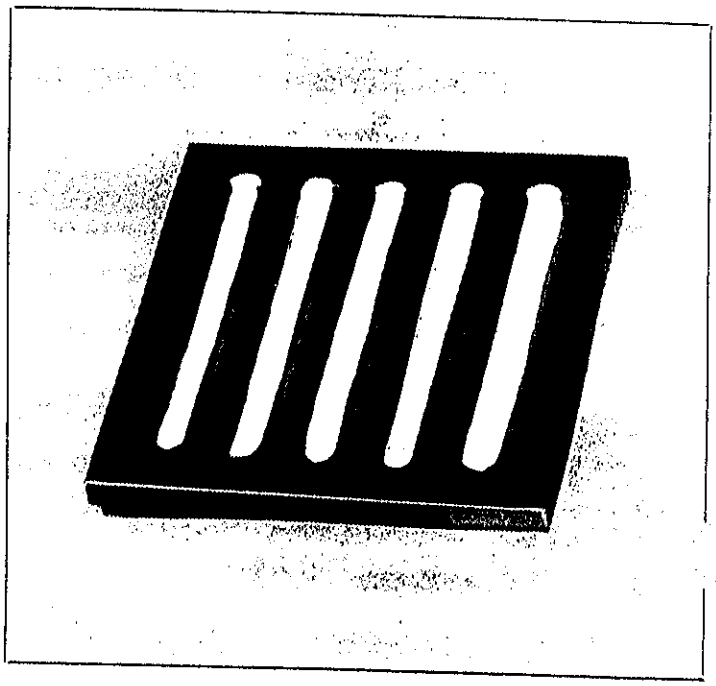
## LOUVERED GRATING /Model #FG

Grating to be fabricated of 14 gauge 18-8 type 304 stainless steel.

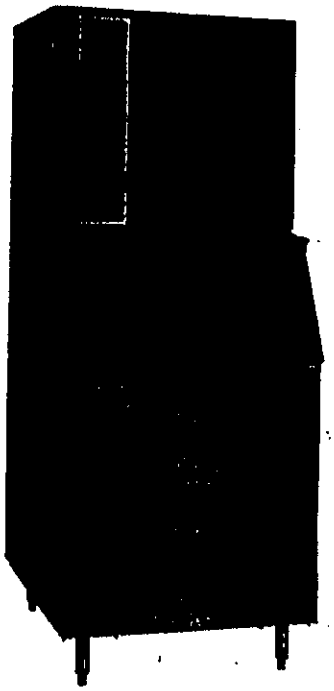
Gratings are 1″ thick and have die formed louvers, one piece design with a #3 polished finish.

They are fabricated in approximately 20″ lengths and are easily removed for cleaning in dishwasher.

(Longer lengths available upon request.)



#92



ICE 1000 shown on model B-55 Bin

## ICE 1000

**Produces up to 1201 lbs. (546 Kgs.)* of ice per day.**

- Constructed from sturdy, corrosion-proof 304 stainless steel—inside and out.
- Most advanced "Harvest Assist" system gets ice to the bin quicker. It conserves energy and increases compressor life.
- Easy to service and install. The ICE Series™ machines have electro-mechanical controls.
- Works on all standard industry dispensers and bins.
- Environmentally responsible. All ICE Series™ machines use R-404A, an approved, non-ozone depleting refrigerant.
- Proven "classic cube" shape. Half cube and Full cube systems available.
- Available with an air-, water- or remote-cooled condenser.

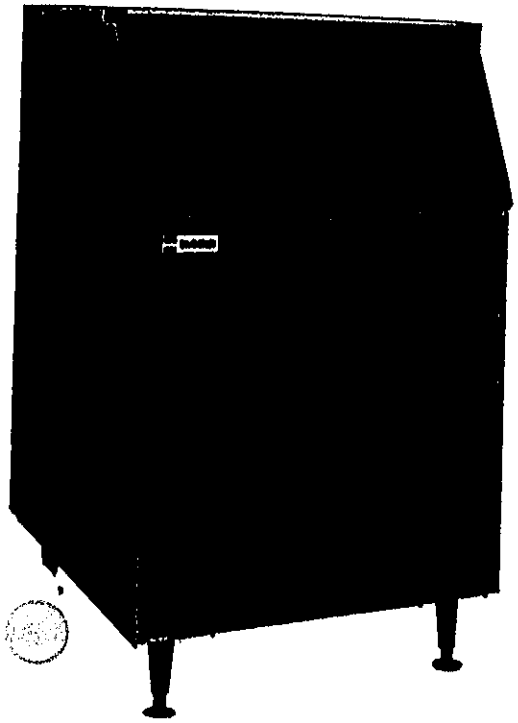
## B Series

### Storage capacity from 255 lbs. (116 Kgs.) to 1866 lbs. (848 Kgs.).

- Dependable storage for either cube ice or flake ice.
- Use with ICE, ECP, GC or EMF Series ice makers.



**Model B55 Storage Bin**

**B25 to B100**

- Insulated on all sides and bottom with foamed-in-place polyurethane. Non-corrosive bin liner and molded plastic door.
- Stainless steel exterior (except B25 which has polyethylene molded exterior and interior).
- 6" to 7" (152 to 178mm) adjustable NSF approved legs.
- Bin drains are located at the rear of cabinet.

**B120 to B170**

- "SP" models have all stainless steel front and side panels, and galvanized back and bottom.
- "SS" models are all stainless steel: front, back, bottom, top and sides. All stainless steel is 300 series.
- All welded stainless steel door frame with all stainless steel, fully insulated, and gasketed door, providing a completely sanitary seal. Hold open clips provided for convenience when using door.
- Roto molded snout is dent and scratch resistant. The snout clips to bin front for convenience and safety. It can be easily removed for shoveling ice and cleaning.
- Sliding, plastic view window provides access for ice breakup.
- Bin liner is polyethylene. Foamed-in-place insulation is 2" (51mm) thick on bottom and 1-1/2" (38mm) on walls, providing maximum ice preservation.
- 6" (152mm) adjustable black metal legs standard.

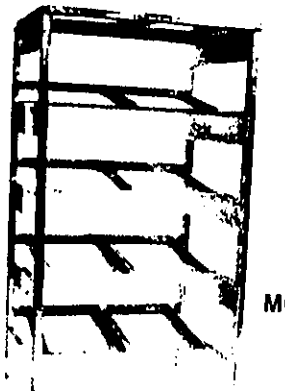
QUANTITY ITEM NO #94

# YRUP CONTAINER RACKS

## RIES BIB AND STR



MODEL BIB57-1216-8

MODEL STR2

### SPECIFICATIONS

Series BIB aluminum "bag-in-box" syrup container rack.

**FRAME:** The uprights are 1" x 2" x ⅛" thick extruded aluminum channels and the cross members are 1⅞" x 4" x 1⅞" x ⅛" thick aluminum channels, welded together to form a rigid structure. A solid reinforced top of .060" thick aluminum is securely fastened to the uprights and cross bracing. The uprights are fitted with adjustable flanged feet.

**SHELVES:** The shelves are all-welded open frames fabricated of 1" x 2" x 3/16" thick aluminum angles and set on an incline in the frame to receive the box syrup containers. Clearance between the supports is 12".

ODEL BIB57-1216-8 "BAG-IN-BOX" RACK
Dimensions: 30¾"W x 24 3/16"D x 57"H
Capacity: 8 syrup boxes
Shipping weight: 80 lbs.
**NOTE:** Other sizes and capacities available.

---

Series STR aluminum syrup tank racks.

**FRAME:** The uprights are 1" x 2" x ⅛" thick extruded aluminum channels and the cross bracing is 1¼" x 2" x ⅛" channels and 2" x 2" x ⅛" aluminum angles, fully welded to form a rigid structure. Between the uprights, 1" square aluminum tubing is welded horizontally on the rear and sides, to act as retainers for the metal syrup tanks. The uprights are fitted with adjustable bullet feet.

**SHELVES:** The bottom shelf is fabricated of .100" thick aluminum turned up 1" on the ends and rear and turned down 2" on the front. It is reinforced longitudinally with two 1" x 3" x ⅛" thick tubular members and crosswise with two 2" x 4" x ⅛" flanged channels. The upper shelves are .100" thick aluminum with .140" thick formed dividers to hold the empty syrup tanks in position.

**REAR PANEL:** A full length x 8" x .100" thick aluminum panel is welded in place on the rear side to provide a mounting surface for the beverage system components as supplied and installed by others.

**OPTIONAL ITEM (Series STR)**

☑ Top shelf solid (reinforced) in lieu of channels.

☐ MODEL STR1 (one upper shelf)
Dimensions: 48¼"W x 24"D x 42"H
Capacity: 10 full syrup tanks and 5 empty tanks
Shipping weight: 60 lbs.

☐ MODEL STR2 (two upper shelves)
Dimensions: 48¼"W x 24"D x 56"H
Capacity: 10 full syrup tanks and 10 empty tanks
Shipping weight: 80 lbs.

☑ MODEL STR3 (three upper shelves)
Dimensions: 48¼"W x 24"D x 70"H
Capacity: 10 full syrup tanks and 15 empty tanks
Shipping weight: 100 lbs.

OTE: Other sizes and capacities available.

# BUNN®

# Twin 3 Gallon Automatic Electric Coffee Urn

## Features

### Automatic Electric Coffee Urn

- Brews 18.1 to 20.9 gallons of perfect coffee per hour.
- Unique design assures extremely low evaporation loss to maintain the brew at its flavorful peak.
- Large water tank–over 20 gallons.
- Draw off hot water during brewing cycle without affecting coffee quality.
- Half-batch option.
- Top mounted components for ease of service.
- All stainless steel construction.
- Variety of faucet configurations available; including double service with faucets on both front and back.
- International electrical configurations available.

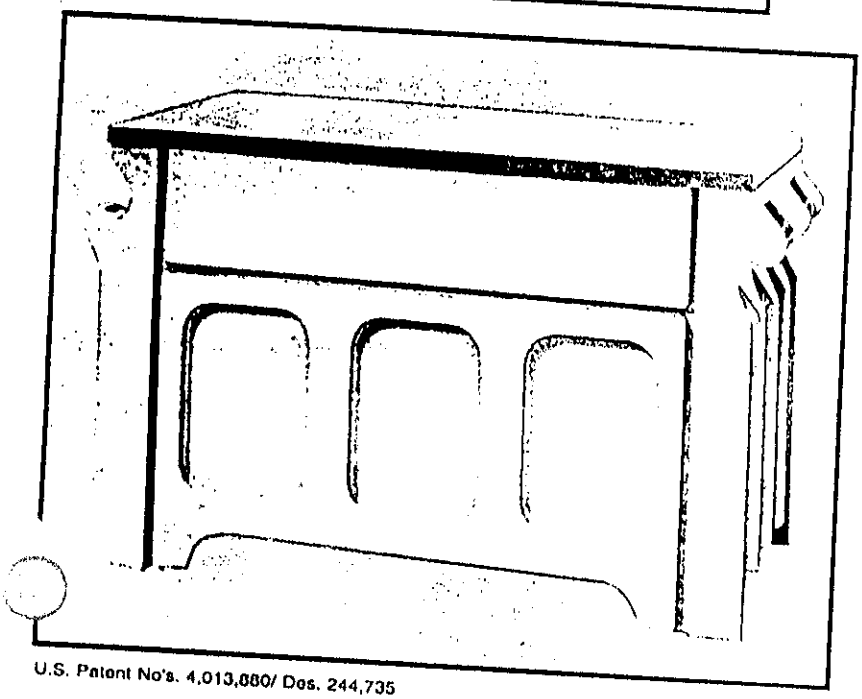
## Flat Top Utility Module

Item No. #97

**Model No. 9310**
**Model No. 9330**
**Model No. 9340**
**Model No. 9350**

A1A11420



U.S. Patent No's. 4,013,680/ Des. 244,735

**Utility Module** – Attractively merchandises and sells pastries and breads. Helps to increase check averages. Available in four widths.

- Aesthetic design, three neutral colors, dove white, pewter tan or black pearl blend in with any surroundings.
- Four built-in & concealed stainless steel handles allow easy portability.
- Self-locking and self-aligning features eliminate time consuming hookup.
- Lightweight but extra-strong construction provides ease of mobility.
- Casters and brakes are almost completely concealed from patron's view.
- Soft textured surfaces and rounded corners help prevent skin cuts and clothing snags.

**Utility Module**

| Cat. No. | Module Size W | D | H | Shpg. Wt. Lbs. | Quantity of Decorator Panels Included |

| 9340 | 64 ½" | 53 ½" | 22 ¾" | 58 ½" |
| 9350 | 79" | 68" | 22 ¾" | 73" |

To be **Galley® Line** Flat Top Utility Module_____ with accessories as specified.

**GENERAL:** Unit to be self-contained, mobile Utility module for room temperature foods. Body material to be one of three neutral base colors, dove white, pewter tan or black pearl. "Matelock" self-locking and aligning end panels allow modules to be interconnected. To have recessed push handles at each end. Removable side panel on customer's side to be recessed to accept decorator panels. Server's side to be open to accept accessories. To be listed by National Sanitation Foundation and Underwriters Laboratories, Inc.

**CONSTRUCTION:** Body material to be of flame retardant ABS formed plastic fastened to galvaneal undercarriage. 14 ga. 300 series stainless steel top to have not less than #4 finish. Plate mounted 4" diameter swivel casters with toe brakes to be provided.

**NOTE:** If unit is to be used independently, add 4" to width for clearance on all specifications. Add 3 ½" to depth for folded trayslide and 3 ¼" for folded cutting board.

# NEW! PACKET RACKS

CARLISLE FoodService Products

#98

Carlisle Packet Racks hold all types of condiment packets, utensils, straws, and napkins in compact units that take up very little counter space. Use front-of-the-house for self service dispensing, back-of-the-house for quick refills, or at wait stations to keep things organized and within easy reach.

- unique containers have a drop-in card holder molded into the front and each unit comes with a set of 31 common label cards for organizing and identifying contents
- for use on counter or mount to wall with screws (included)

**Aluminum Frame**

- sturdy frame with rugged plastic containers; available in three sizes

**Wire Frame**

- economical chrome wire frame with durable plastic containers
- single frame holds either 9 ea 2-1/2 qt containers or 6 ea 4 qt containers

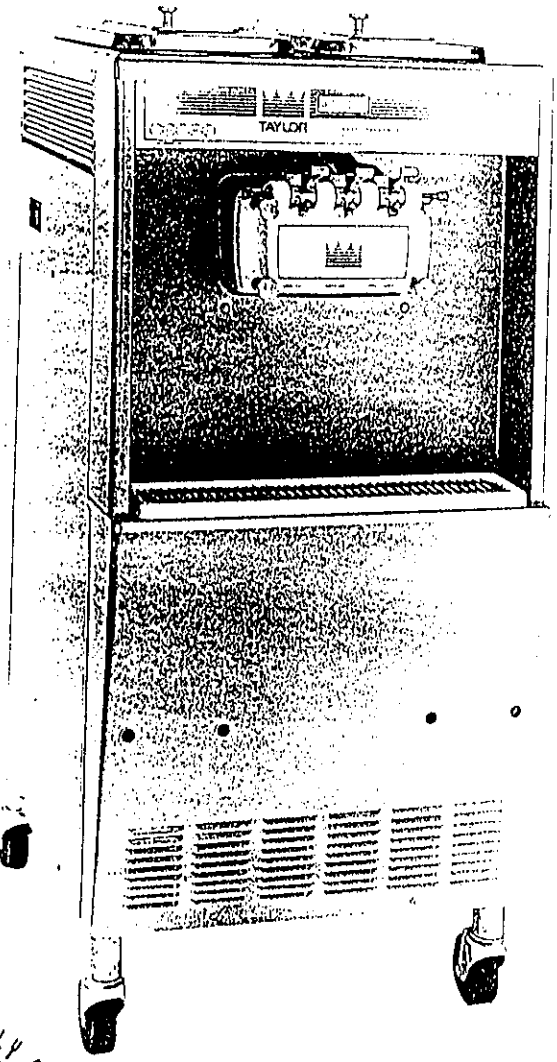
#101

Model

# H84/PH84

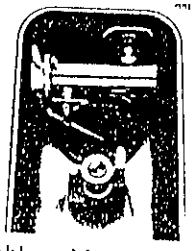


This twin twist soft serve freezer is part of the Universe Series which combines the latest research and development in a heat treatment process.

The Model H84 is designed to provide a safe, sanitary environment, yet reduce the tiresome task of daily cleaning. The revolutionary heat treatment system provides a unique, timed heating and cooling system which safely maintains the product up to two weeks before a routine cleaning is required.

The Model H84 is the safe, sanitary way to offer all the popular soft serve variations like low fat and no fat ice creams and yogurt.

Increase your sales and multiply your profits with the Taylor Model H84.



Also available as Model PH84 with In-Hopper Air/Mix Pump

TAYLOR®

Taylor world-wide distributor network offers the most complete equipment, factory trained service technicians, full parts ory, merchandising programs, financing, and leasing capabilities eet your needs. Your local distributor is a Taylor professional who can assist in planning your profit potential.

To project your own profit potential, use the chart provided.

## EATURES

**reezing Cylinder**
wo, 3.4 quart (3.2 liter) cylinders r fast and steady production.

**lix Hopper**
wo, 20 quart (18.9 liter) capacity ppers. The insulated hoppers are frigerated during normal and andby operation to maintain the ix below 41°F (5°C).

**dicator Lights**
warning light flashes alerting the perator of insufficient mix level. 'hen the mix out light flashes, the nit is automatically placed in the Standby" mode, protecting the eezer from damage.

**lectronic Controls**
ne software in the Universal ontrol is programmed to monitor l modes of operation. Product scosity is continually measured to sure consistent quality at all nes.

**ower Interrupt and Lock-out**
his computer based safety feature programmed to alert the operator product reaches unsafe mperatures as a result of power ss. If Heat Treatment features e improperly used, the unit tomatically locks all freezer nctions until proper measures e taken to ensure health codes e met.

**CD Readout**
o assure proper performance, the CD (Liquid Crystal Display) adout will identify temperatures the hopper or freezing cylinder at ny point of operation. This feature an also provide history of mperatures and times during the st 13 heat treatment cycles.

**horough Agitation**
roduct is continually agitated in ne hopper during the heat eatment cycle, and as necessary to naintain the mix below 41°F (5°C) "Auto" or "Standby."

**n-Hopper Air/Mix Pump**
umps (available as Model PH84) re located in the hoppers to naintain product quality and verrun at desired levels.

## OPTIONS

- Cone Dispenser
- Faucet
- Draw Valve Lock Kit
- Panel Spinner

Consult your local Taylor distributor for availability of these options. All options may not be available in combination with others.

## SPECIFICATIONS

**Beater Motor**
Two, 1.5 hp.

**Refrigeration Unit**
Two, approximately 9,500 btu/hr compressors. (BTU's may vary based on compressor used.) R404A.

**Air Cooled**
Clearance: 3" (7.6 cm.) around all sides. A deflector has been added to underside preventing recirculation of warm air. This will assure proper air flow across condensers to obtain optimum performance.

| Model H84 | One dedicated connection | |

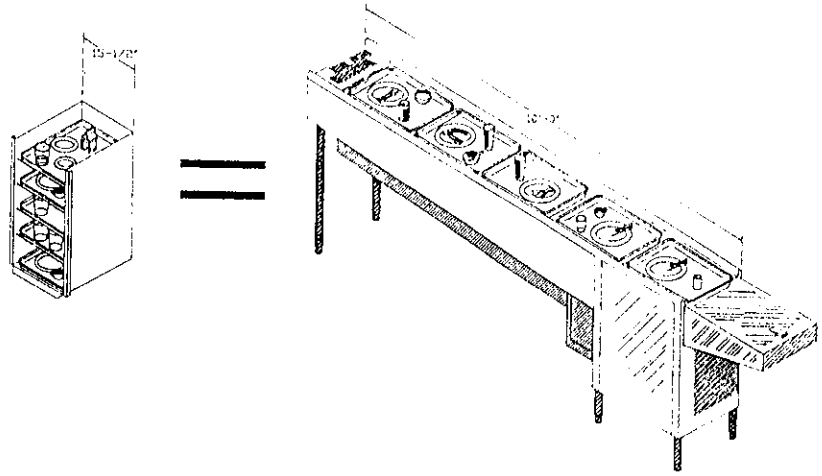
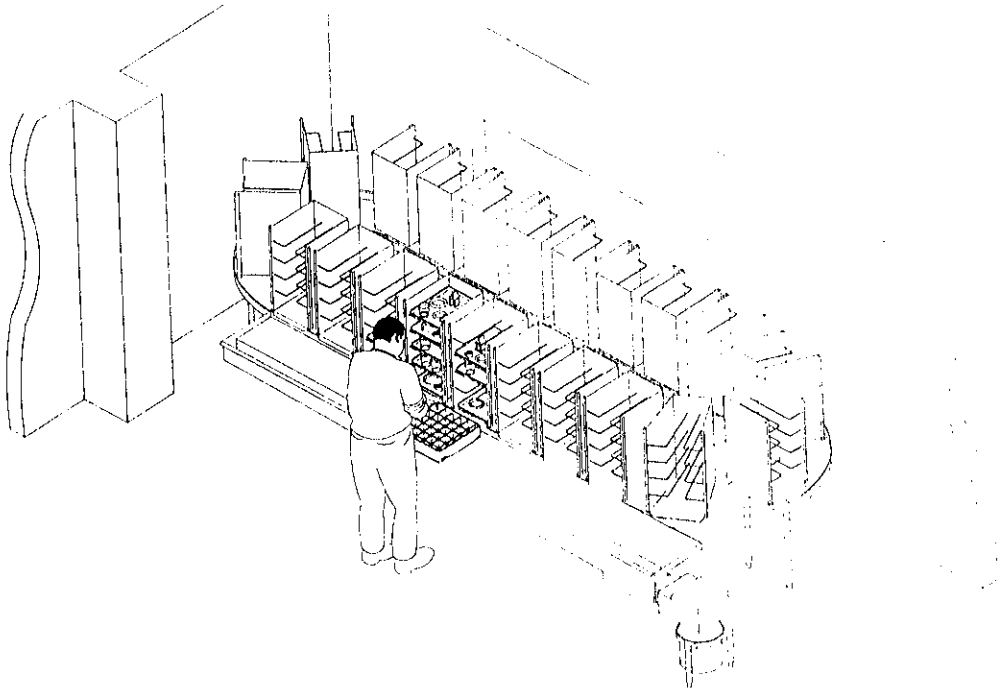
ITEM #102

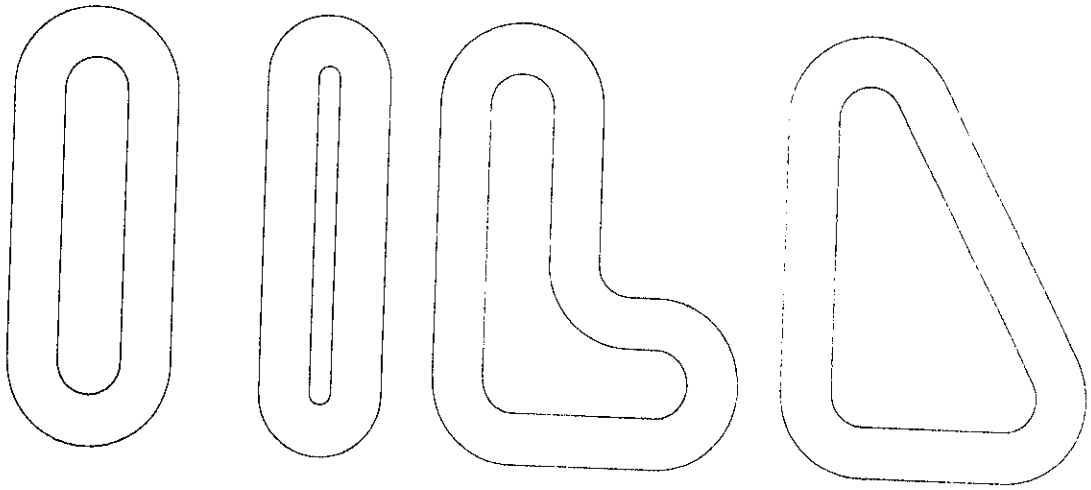
# THE STERO STAC
## SOILED TRAY ACCUMULATING CONVEYOR



One 15½ inch tray carrier is equal to approximately 10 feet of conventional soiled tray conveyor.



An optional scrapping trough can be added to any STAC unit. The one pictured accommodates a 20x20 inch rack for loading glasses, utensils and other rackable items. The scrapping trough can be connected to a disposer, hommel pot, compactor or a pulper.



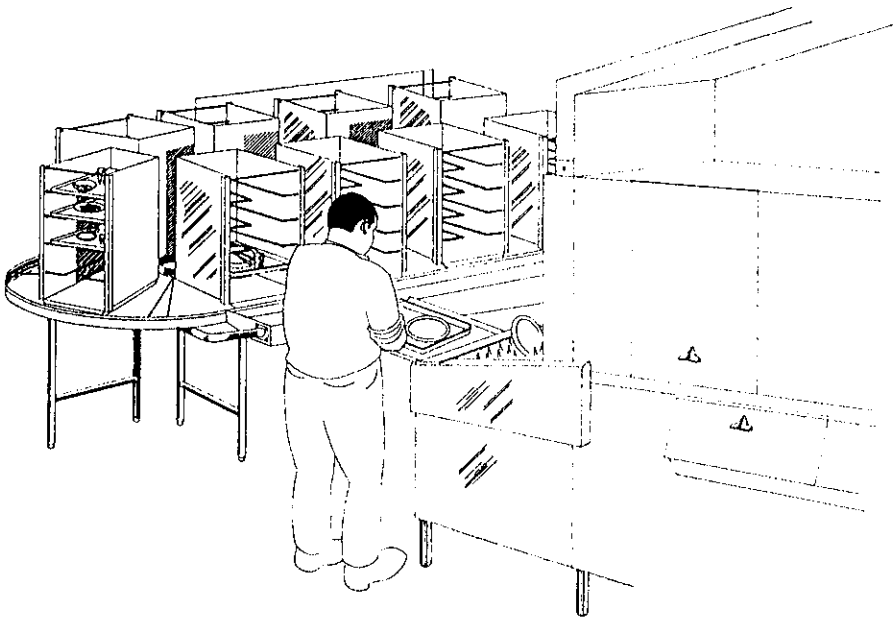
The STAC can be manufactured in many configurations to fit a particular layout. Call a trained representative or the factory for suggestions and floor plans.

The STERO STAC Tray Accumulating System offers a truly revolutionary and yet practical alternative to conventional tray conveyor systems.

The STAC is a self-bussing system that accommodates five times more trays than a conventional flat belt conveyor because the trays are vertically loaded in STERO's unique five tiered carrier. The STAC eliminates tray pile-up at the load and unloading points because the trays are randomly placed and removed on the carriers which are in turn conveyed around the system. Breakage is greatly reduced because of the STAC's smooth riding design and ease of loading and unloading.

The STAC is a true accumulator. Depending on the unit's size, it can be turned on and left to accumulate trays while the dishroom staff can be employed at other tasks.

The STAC is loaded by dining room patrons through a pass-through window, usually located near the dining room exit.



The STAC to machine transition is made easy with a sorting bridge and optional scrapping trough. The operator can work at his own pace as missed trays are conveyed around the accumulator for another

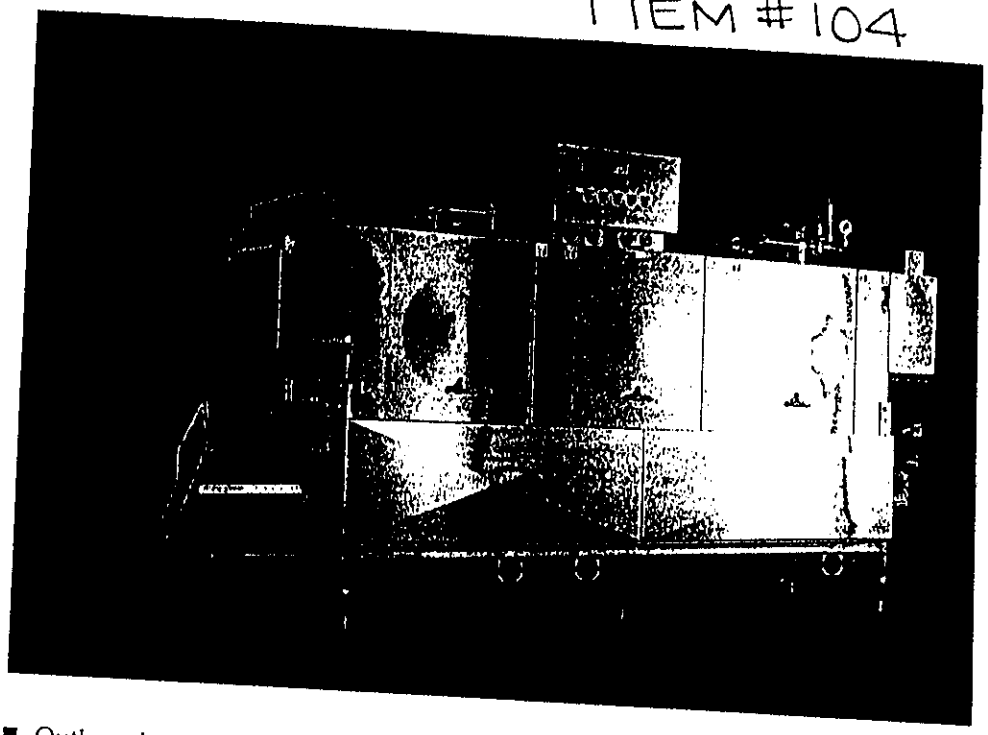
ITEM #104

*Stero's maximum capacity three tank conveyor ware washers. Three models to choose from.*



### Complete High Volume Performance in a Straight Through Conveyor

- Each machine has a separate scrapper, wash and rinse tank with a final rinse.
- Each tank independently sprays 185 to 300 gallons of concentrated recirculated water over the ware per minute, depending on the model number.
- Produces 247 to 308 racks of clean ware per hour, depending on the model number.

### Designed for Easy Operation

- Racks are conveyed through the washer by Stero's own stainless steel center driven pawl system.
- The operator advances the loaded rack of ware through flexible strip curtains to begin the automatic conveyance of the ware through the scrapping, wash, rinse and final rinse sections.

### Power Scrapping Eliminates Pre-Rinsing

- The power scrapper pre-cleans the ware 185 to 300 gallons of concentrated water per minute (depending on the model number) thus eliminating an entire dishroom task.
- Automatically scrapped soil is flushed over inclined scrap screens into an outboard scrap catchment.
- Outboard scrap catchment can be cleaned from the exterior of the machine while it remains in full operation.
- Expended final rinse water is piped to the scrapper section to be recycled.
- Power scrapping reduces detergent consumption.

### Unique Power Wash and Rinse

- Stero's unique stricture free center fed manifolds evenly distribute 225 to 300 gallons (depending on the model number) of recirculated wash water over the ware per minute.
- Center fed manifolds are easy to remove, easy to clean and require no tools.
- Unique Stero end caps easily unscrew by hand.
- Stainless steel strainer pans efficiently filter recirculated water.
- Easy to read temperature gauges monitor all tank temperatures.

### High or Low Temperature Final Rinse

- Both are automatically activated only when a rack passes through the final rinse section.
- High temperature final rinse distributes 3.76 to 4.53 gallons (depending on model number) of 180 degree water over ware per minute.
- These machines are also available in a low temperature 140 degree final rinse CSA model by specifying an optional Stero chlorine dispenser.
- Low temperature final rinse eliminates the need for a hot water booster heater.

*(continued...)*

Stero

*The Stero Company*
*3200 Lakeville Highway ■ Petaluma, CA 94954-5675*
*■ Toll Free 800-762-7600*

### *Standard Safety Features*

- Door safety switches prevent the machine from operating unless the doors are fully closed.
- Conveyor release housing will prevent damage to the machine and ware in the event of jamming.

### *Standard Features Engineered for the End User*

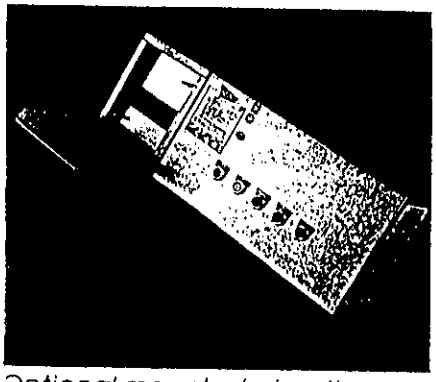
- Type 304, 18-8, #4 stainless steel tank and hood.
- Stainless steel frame and legs.
- Enclosed adjustable stainless steel feet.
- Stainless steel strainer pans cover tank and efficiently filter recirculated water.
- 2 HP drip-proof pump motor with overload protection, extended shafts, sealed ball bearings and manual reset buttons.
- 1/4 HP conveyor drive motor.
- Self draining centrifugal pump with removable inspection plates.
- Durable poppet drain valve has replaceable parts.
- All machines are completely inter-plumbed and wired.

### *Tank Heat Options — Choose One*

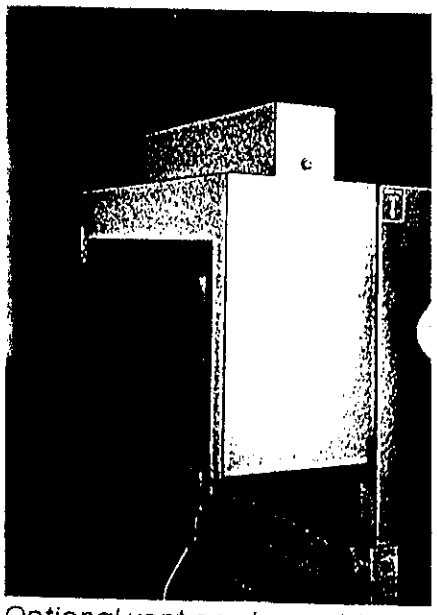
- Infrared gas tank heat thermostatically controlled and is equipped with low water cut-off.
- Electric tank heat, thermostatically controlled and is equipped with low water cut-off.
- Steam injectors, thermostatically controlled and equipped with steam silencers and low water cut-off.
- Steam coils, thermostatically controlled, provide for a completely closed heating system and are equipped with low water cut-off.

### *Miscellaneous Options*

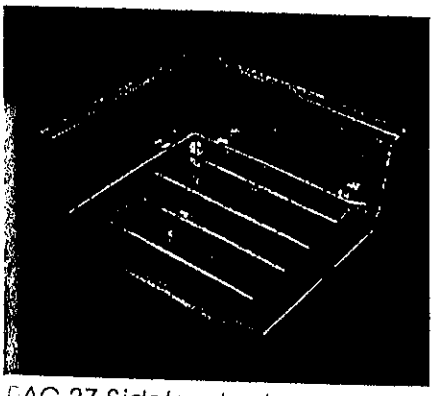
- Kit #55, a complete plumbing system installed that contains a pressure reducing valve, shock arrester and a flow pressure gauge.
- Auto Shut Down device starts the machine when racks enter and shuts the unit off if no racks are being washed.
- RAC-27 sideloader converts conveyor machines to a corner load application.
- Chlorine dispenser, completely installed and plumbed.
- Common drain provides a single 2 inch waste connection.
- Stainless steel front enclosure panel.
- Vent cowls with adjustable damper.
- Low pressure steam package available for applications where steam pressure falls below 15 PSI.



*Optional mounted circuit breakers provide a single point connection.*



*Optional vent cowls provide efficient ducting of steam and excess heat.*



*RAC-27 Sideloader transforms a straight through machine into a space saving corner model.*

# IMPERIAL ELECTRIC BOOSTER WATER HEATERS

Models S-6, -7, -9, -12, -13, -15, -17, -18, -24, -27, -30, -36, -39, -40, -45, -54, -58

#104a

The Hatco Imperial Electric Booster Water Heater combines quality construction and rugged dependability to provide up to 600 GPH (2300 LPH) of sanitizing rinse water. Dishes and flatware *air-dry* instantly to save time, space and money. Storage capacity is 16 gallons (60 liters).

## FLEXIBILITY

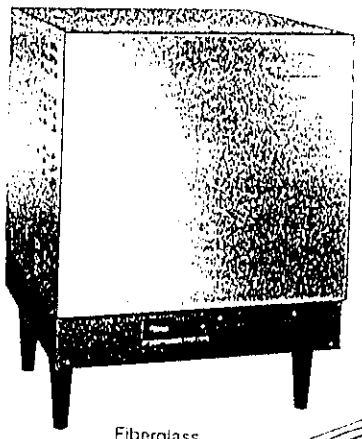
Models available from 6kW to 58.5kW in 208, 240 and 480 volts with other voltages available. The Imperial Electric Booster Heater thermostats can be lowered to a 140°F (60°C) setting for low-temp dishmachines.

Service area is accessible from the front to permit easy installation, even next to other equipment.

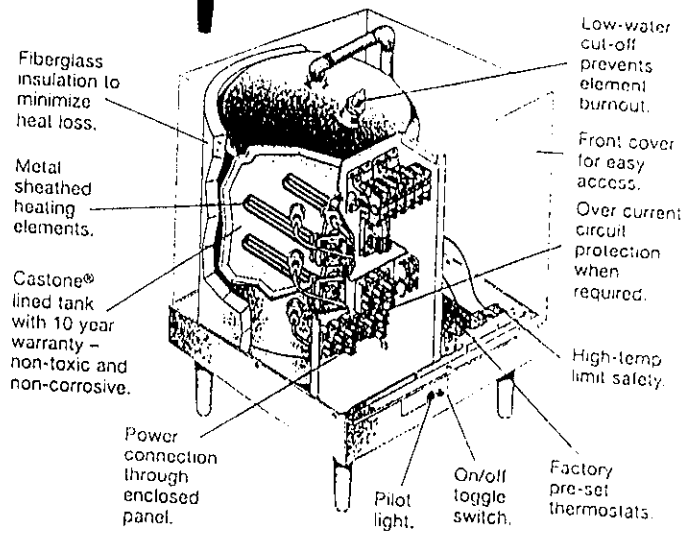
## QUALITY

The following features assure the finest performance for years to come.

- All models include a Castone® lined tank with a 10 year limited warranty.
- Features include a temperature/pressure relief valve, a cast iron pressure reducing valve, two temperature/pressure gauges, a high temperature limit control, pilot indicator light, on-off switch and a low water cut-off to prevent element burnout due to low water condition.
- Each booster has a built-in heat trap and fiberglass insulation to minimize heat loss.
- Low water protection prevents heating element burnout, and alerts operator to low water condition.
- Hatco electric booster heaters are factory pre-plumbed and pre-wired with calibrated immersion thermostats and high temperature limit switch.
- A stainless steel front panel and powder coated silver gray hammertone body is standard on all Imperial models.



Model S-54



Water Temperature Recovery Table

## WATER QUALITY REQUIREMENTS

Incoming water in excess of 3.0 grains of hardness per gallon (GPH) (.75 grains of hardness per liter) must be treated and softened before being supplied to booster heater(s). Water containing over 3.0 GPH (.75 GPL) will decrease the efficiency and reduce the operating life of the unit.
*Note: Product failure caused by liming or sediment buildup is not covered under warranty.*

* Only 6, 7 & 9kW Models, 208 and 240 volts only, can be field converted to single phase (units are shipped 3-phase open delta). Larger branch circuit required than for balanced 3-phase of equal kW. (Balanced 3-phase available, consult factory.)
‡ 17.2kW Models available in 208v 3-phase only.
§ 18kW Models not available in 208v 3-phase.
* Not available in 208v single phase.
** Not available in 208v or 240v single phase.

## OPTIONS (NOT FOR RETROFIT)

- ❑ All Stainless Steel Body and Base

## ACCESSORIES

- ❑ Blended Phosphate Water Treatment System
- ❑ Shock Absorber – To Reduce Water Hammer
- ❑ Brass Pressure Reducing Valve with By-Pass
- ❑ Floor Mounting Hardware
- ❑ Adjustable Stainless Steel Legs 6" to 8" (15 to 20 cm)

## ARCHITECT SPECS

### Electric Booster Water Heaters

The Electric Booster Water Heater to supply the final 180°F (82°C) rinse for the dishwasher shall be a Hatco ....Model No. ....as manufactured for commercial use by the Hatco Corporation, Milwaukee, WI 53234 U.S.A.

The booster shall have the capacity to heat ....gph (lph) from ....°F to 180°F (....°C to 82°C) and it shall be rated at ....kW, ....volts, ....phase. The tank shall be designed for a working pressure of 150 psi (1034 kPa) and include a Hatco Castone® lining.

The heater shall be complete with all internal plumbing, including ¾" NPT pipe and fittings for inlet and outlet. All controls shall be built-in, including contactors and prewired in accordance with UL #1453 and NEC 422-27. Proper surface mounting circuit breaker or fused disconnect switch shall be provided by electrical contractor.

Electric heating elements shall be metal sheathed, controlled by close tolerance immersion thermostats. The booster shall be protected with high temperature limit switch (ECO) and low water cut-off.

The heater shall consist of stainless steel front and silver gray hammertone body with standard 6" (15 cm) legs (or stainless steel body, base and stainless steel adjustable legs).

The heater shall include a temperature/pressure relief valve, high-temperature pressure reducing valve with bypass, indicating temperature/pressure gauges and shock absorber.

# somat®

## Remote Waste Pulping System

Item No. #105

SOMAT Model: HE-9TS
Hydra-Extractor

## Description

Standard SOMAT™ Model HE-9TS Hydra-Extractor™ with two, 5 HP drive motors, 5 HP or 7-1/2 HP return pump, chemical additive pump, automatic rinse system, valve package, Som-A-Trol™ control panel and discharge chute with limit switch.

### Benefits

- Up to 80% volume reduction
- Reduced labor cost
- Better sanitation
- Water conservation
- Improved operator morale
- Reduced silverware loss
- Processes a wide variety of waste

**Operation:** Slurry, consisting of 5% solids and 95% water, is automatically transported through a pipeline after being processed in the pulper(s) to the Hydra-Extractor, where water is removed and the resultant semi-dry pulp is discharged into a haul-away container. The extracted water is recovered and returned to the pulper(s) for re-use.The capacity of the Hydra-Extractor determines how many pulpers can be designed to operate with it concurrently.

Somat equipment provides an economic and efficient answer to cutting the high and ever increasing costs associated with waste handling. Manufactured by Somat Corporation of Coatesville, Pennsylvania, originators of waste pulping systems and specialists in waste reduction technology.

**Approval:**

## Technical Specifications

**Hydra-Extractor™:** Rigid stainless steel weldment with stainless steel legs, head assembly with two, 5 HP TEFC belt driven motors each matched to a 25:1 gear reducer, 28" long stainless steel discharge chute with limit switch, chemical additive pump, automatic rinse system. Water extractor mechanism consists of two, 9" diameter stainless steel screws each with a nylon brush edge, stainless steel adjustable gate and matching 9" diameter reinforced stainless steel screen.

**Valve Package:** All valves required for proper operation (automatic rinse system).

**Som-A-Trol™ (Electrical Control Panel):** UL approved. Includes all necessary electrical components prewired to a terminal strip in a NEMA 12 carbon steel enclosure.

### Options Available:

(see accessory sheet for description)

- ☐ Extended discharge chute
- ☐ Hinged chute
- ☐ Extended stand
- ☐ Pulp level detector
- ☐ NEMA 4 stainless steel Som-A-Trol
- ☐ Special electrical characteristics

### Special Requirements:

- 10 HP or larger return pump. Determined by piping conditions.
- Water economizing tank. Required when 10 HP or larger return pump is used.
- Pulp Screw Conveyor and controls. Required to convey pulp from discharge chute to haul-away container when location of container does not permit gravity discharge.

**Electrical Characteristics:** 208/230/460 Volt, 3 Phase, 60 Hertz

**Capacity:** 4,000 pounds per hour of foodservice waste mix, consisting of food scraps, plastics, milk cartons, paper, aluminum foil and cardboard

**Finish:** All exterior surfaces, except where polished stainless steel, are prime coated and finished with two coats of enamel paint.

Equipment only is supplied by SOMAT Corporation, installation, piping and wiring is not included.

## Somat Model HE-9TS Hydra-Extractor including:

1 Hydra-Extractor
2 (2) Hydra-Extractor drive motors, 5 hp ea.
3 Return pump, 7 1/2 hp
4 Autorinse spray system
5 Chemical Additive pump
6 Discharge chute, 28" lg. w/limit switch
7 Som-A-Trol panel (24"h x 20"w x 8"d)

## Utility Connections:

8 Fresh hot water inlet, 3/4" npt
9 Slurry inlet, 4" npt
10 Return pump outlet, 3" flanged
11 Autorinse drain, 1 1/2" npt (located on return piping assy.)
12 Customer power supply (4 wire service required)

## Dimensions:

**Height:** 107" (2720 mm)
**Length:** 71" (1805 mm)
**Width:** 36" (915 mm)

**Equipment Weight/Operating Weight:** 1660 lbs./1995 lbs.
**Crated Weight:** 1760 lbs.
**Crated Volume:** 128 cu. ft.

## Utility Requirements:

- Fresh hot water, 18 gpm @ 45 psig, 3/4" npt (approximate usage 180 gallons/cycle)
- Drain, 6" min. floor sink w/stainless steel removable basket.
- Power, 208V-60 amps; 230V-60 amps; 460V-30 amps, 3 phase, 60 Hz. (disconnect with circuit breaker provided in Som-A-Trol)

You'll find us in First Place.

## Floor Mounted 9-OP Series Specifications

(For conventional and economy see back)

### FEATURES:

Floor mounted unit eliminates the need of lifting heavy containers

No-Drip die formed recessed V-edge on three sides with a tile edge furnished on the rear.

Sink Bowl is seamless and is **Deep Drawn** designed.

**Deep Drawn** bowls having large liberal radii with a minimum of 3" and rectangular in design for increased capacity.

### CONSTRUCTION:

All TIG welded.

Welded areas blended to match adjacent surfaces and to a satin finish.

### MECHANICAL:

Supply is 1/2" IPS hot & cold.

Drain is cast brass with 2" IPS male threads.

Stainless steel drain body is designed for easy installation to threaded coupling.

Faucet holes on 8" centers.

Faucets are not included (see accessories).

### MATERIAL:

Heavy gauge type "304" series stainless steel.

## SPECIFICATIONS / FEATURES

***CABINET CONSTRUCTION:***
- .040 copper aluminum exterior.
- White anodized aluminum interior top cabinet liner with 300 series stainless steel floor. Construction of liner in accordance with NSF standards.
- Cabinet mounted on a welded, galvanized frame rail, painted for additional corrosion protection.
- Safety shielded fluorescent interior lighting.

***DOORS:***
- Triple pane thermal insulated glass. Doors extend full width of cabinet shell. Door gaskets of one piece construction.
- Adjustable torsion spring mechanism. The face of each door fitted with a 12" long handle.

***INSULATION:***
- Entire cabinet structure insulated, using foamed-in-place CFC free polyurethane foam.

***SHELVING:***
***wire shelf models***
- 4 adjustable vinyl coated wire shelves. Shelves capable of supporting up to 250 lbs.
- Full height shelf support pilasters, with double oblong holes on 1/2" centers. Pilasters made of the same material as cabinet interior. Four (4) chrome plated, stainless steel shelf clips to be included for each shelf.

***glass shelf model***
- 6 removable 19 5/8" glass shelves. Bottom mirrored shelf for reflective display. Shelves capable of supporting up to 30 lbs.
- shelves slowly revolve.

***REFRIGERATION SYSTEM:***
- Refrigeration system factory balanced using CFC free 134A refrigerant.
- Bottom mounted condensing unit - easy access for maintenance.
- Factory pre-engineered capillary tube system with oversized condenser and evaporator to reduce product pull down time and to consistently maintain 32°-38°F interior cabinet temperature. (non-adjustable capillary tube system superior to problematic expansion valve)
- Evaporator - epoxy coated at the time of manufacture to eliminate the potential of corrosion.

***ELECTRICAL CHARACTERISTICS:***
- Unit completely pre-wired at factory, and ready for final connection to a 115/60/1 phase - 15 amp dedicated outlet. A cord and plug set to be included.
- A sole use circuit is required.

115/60/1

## ndard Features

igh luster copper aluminum exterior.
/hite anodized aluminum interior top nd stainless steel bottom.
versized and balanced, environmentally iendly refrigeration system - holds 32°F-3°F.
ottom mount compressor.
ide out compressor can be serviced asily and accessed by a single repairman.
ositive seal torsion spring, self-closing oors.

- Adjustable vinyl coated wire shelves (RGS model standard with six glass shelves).
- Epoxy coated evaporator.
- Fluorescent interior lighting.
- Environmentally friendly 134A refrigerant (CFC free).
- 1 year parts & labor warranty (USA).
- 5 year compressor warranty.

## Optional Accessories

- Additional shelves available.
- Barrel locks available.
- Castors and legs available for most models.

### FEATURES:

One piece **Deep Drawn** sink bowl design.

All sink bowls have a large liberal radii with a minimum dimension of 2" and are rectangular in design for increased capacity

### CONSTRUCTION:

All TIG welded.

Welded areas blended to match adjacent surfaces and to a satin finish.

Die formed Countertop Edge with a 3/8" No-Drip offset

One sheet of stainless steel is used. There are no welded seams other than corners.

### MECHANICAL:

Faucet supply is 1/2" IPS male thread hot and cold.

K-59 splash mounted 4" O.C. gooseneck faucet chrome plated furnished with aerator.

K-6 stainless steel basket drain 1-1/2" IPS.

K-26 lever operated drain and built-in overflow with plastic overflow tube and spring clamps.

7-PS-14 P-Trap is 1 1/2" chrome plated.

7-PS-12 Soap Dispenser.

Towel dispenser with hinged cover. Unit uses standard C-fold towels.

Sink bowl is 10" x 14" x 5".

### MATERIAL:

Heavy gauge type 304 series stainless steel.

Wall mounting bracket is stainless steel and of offset design.

All fittings are brass / nickel plated unless otherwise indicated.

## Supremacy Series® Solid/Glass Heated Reach-In

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments. Units are mounted on 6" (15.24 cm) legs.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Hinged glass front door(s). Glass doors are constructed with a combination of extruded aluminum & PVC, and are provided with magnetic gaskets. Doors will have self-closing hinges and continuous handle along vertical dimension of door(s). Glass door constructed to eliminate need for heater wires.

- Please specify right or left hand hinging at time of order.

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-240 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.

**HEATING ASSEMBLY**

Cabinets to be designed to maintain temperature up to 200°F. Helical shaped, tubular fin heating element. High speed blower to provide uniform airflow in cabinet. Removable/replaceable heating system. No exposed elements inside cabinet. Fan and heating elements service accessible without tools. Temperature to be controlled by an adjustable electronic thermostat equipped with an analog display. On/off switch in front.

**OPTIONS & ACCESSORIES**

- Stainless steel backs
- Plastic laminate on doors & ends
- Additional shelves and bridges
- Tray slides
- Kick panels
- Half-size hinged glass or steel stainless doors, two doors per section
- Correctional Facilities package
- 4" Casters

## *ENERGY AIRE* AUTO WASH WALL MOUNTED

**Models**
**AWWO**
**AWWP**
**AWWI**
**AWWE**
**AWWD**

AVTEC

### APPLICATION DATA

For use over all types of cooking equipment; unique grease extractor has auto wash and internal fire protection and extracts up to 95% of grease contaminants. Canopies are generally installed 6'-6" above finished floor. Stainless steel enclosure panels to the ceiling are available, or the hood may be recessed into the non-combustible false ceiling, depending on type of air make up - contact factory.

### SUPPLY AIR MAKE-UP

☐TYPE " P" LOW VELOCITY FRONT DISCHARGE SUPPLY

Integral supply make-up air normally sized at 80% of exhaust volume, remaining 20% from adjacent areas to contain odors within the kitchen. Normally air is heated to 55°-65°F. Consult factory for specifics.

The perforated front panel slows the supply air velocity to lessen the effect of partially tempered outside air on conditioned room air. When lowest velocity is desired, the 30" high plenum [ventilator] is recommended.

☐ TYPE "I" INTEGRAL "SHORT CYCLE" SUPPLY

The integral "short cycle" supply air plenum may be used with up to 70% untempered air per U.L. testing. Some local codes limit this percentage or do not allow the "short cycle" concept. Normally, this type hood is used in warmer climates not susceptible to the colder, higher density winter air.

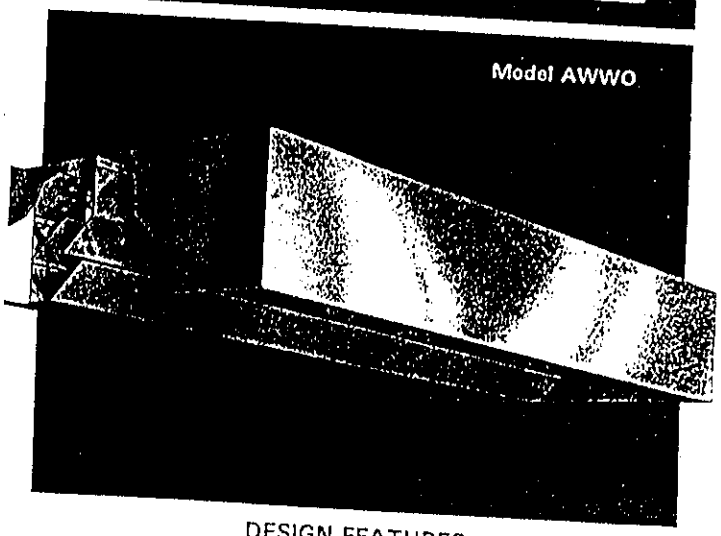
Integral untempered supply make-up air varies according to exhaust requirements, 20% recommended from adjacent areas to contain odors within the kitchen and remaining amount from ceiling registers located ideally 20 ft. from the hood. Consult factory for specifics.

☐TYPE "E" EXTERNAL FRONT GRILL SUPPLY

Same air volumes as "P" type. Recommended for installations where finished ceiling is less than 9 ft. prohibiting effective use of "P" type [above]. The 4-way diffusers and internal balancing dampers allow precise directional control. Generally, air is conditioned to room temperature and directed just below the ceiling.

☐TYPE "D" DUAL EXTERNAL AND INTERNAL SUPPLY

Integral supply make-up air normally sized at 80% of exhaust volume, remaining 20% from adjacent areas to contain odors within the kitchen. A combination of "I" and "E" type, allows for fine tuning of short cycle air supply. Varying climates may require incoming air to be conditioned to room temperature.



### DESIGN FEATURES

- U.L. Listed. Complies with all national codes.
- Auto wash and internal fire protection system.
- Unique extractors remove up to 95% of grease contaminants.
- Integral supply air balancing and fire damper.
- Electromechanical, resettable exhaust fire damper.

### OPTIONS AND ACCESSORIES

- U.L. Listed fusible link exhaust fire damper.
- Stainless Steel enclosure panels to ceiling.
- Auto Wash Control Panel with:
  - √ Fan and/or light switch
  - √ Fire System Interface
  - √ H.O.A. Fan Starter Interface
- Integral fire suppression system enclosure.
- Wet chemical fire suppression system.
- Water mist fire protection system with gas reset.
- Fan motor controller package
- Exhaust & supply fan package

### EXHAUST AIR RECOMMENDATIONS

| TYPE EQUIPMENT | MIN. EXHAUST |
|---|---|
| **Light Duty**<br>Ovens, Steamers, Kettles [25 psig] | 200 cfm/lin. ft. |
| **Medium Duty**<br>Ranges, Griddles, Fryers, Fry Pans, Kettles [45 psig] | 250 cfm/lin. ft. |
| **Heavy Duty**<br>Hot Top Ranges, Upright Broilers, Electric Charbroilers | 300 cfm/lin. ft. |
| **Extra Heavy Duty**<br>Gas and Solid Fuel Charbroilers, Woks [water cooled], Kettles [100 psig] | Consult Factory |

The above figures are to be used as a guideline only. Since local field conditions vary greatly, we strongly suggest you consult the factory or your local AVTEC Representative.

# AUTO WASH VENTILATOR CONTROL PANEL

Model VCWW

AVTEC

U.S. Patent # 4,156,432

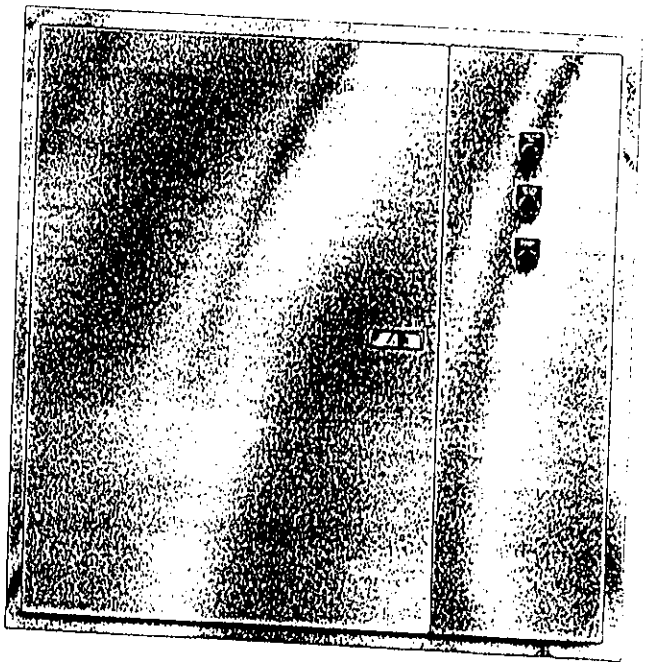
*ECONOMY CONTROL . . WITH AVTEC*

## APPLICATION DATA

The AVTEC Auto Wash Ventilator Control Panel is supplied with the AVTEC Auto Wash Ventilator. The cabinet houses the electrical and plumbing components necessary to control the exhaust [and air make-up] fan(s), auto wash self-cleaning cycle and plenum fire protection system.

One panel will control one or more fans if operated simultaneously. Each panel will operate up to 50 linear feet of ventilator with a single wash [0-10] minutes]; for over 50 feet, use two or more panels. If hot water and low pressure is limited and sequential washes are desired, we recommend the AVTEC "PAWS" Control Panel.

An electric thermal detector fire switch is mounted in the duct collar and automatically activates the plenum fire protection [spray], closes the adjacent fire damper and turns off the fan. An optional flush mounted or remote manual pull fire switch is available to activate the plenum fire protection [spray] and exhaust fan [to remove fumes]. Surface cooking fire protection should be specified with this system. AVTEC'S MIST-A-FIRE System is recommended if a building sprinkler system is available; the control panel for this system may be combined with the AVTEC "PAWS" Control Panel.



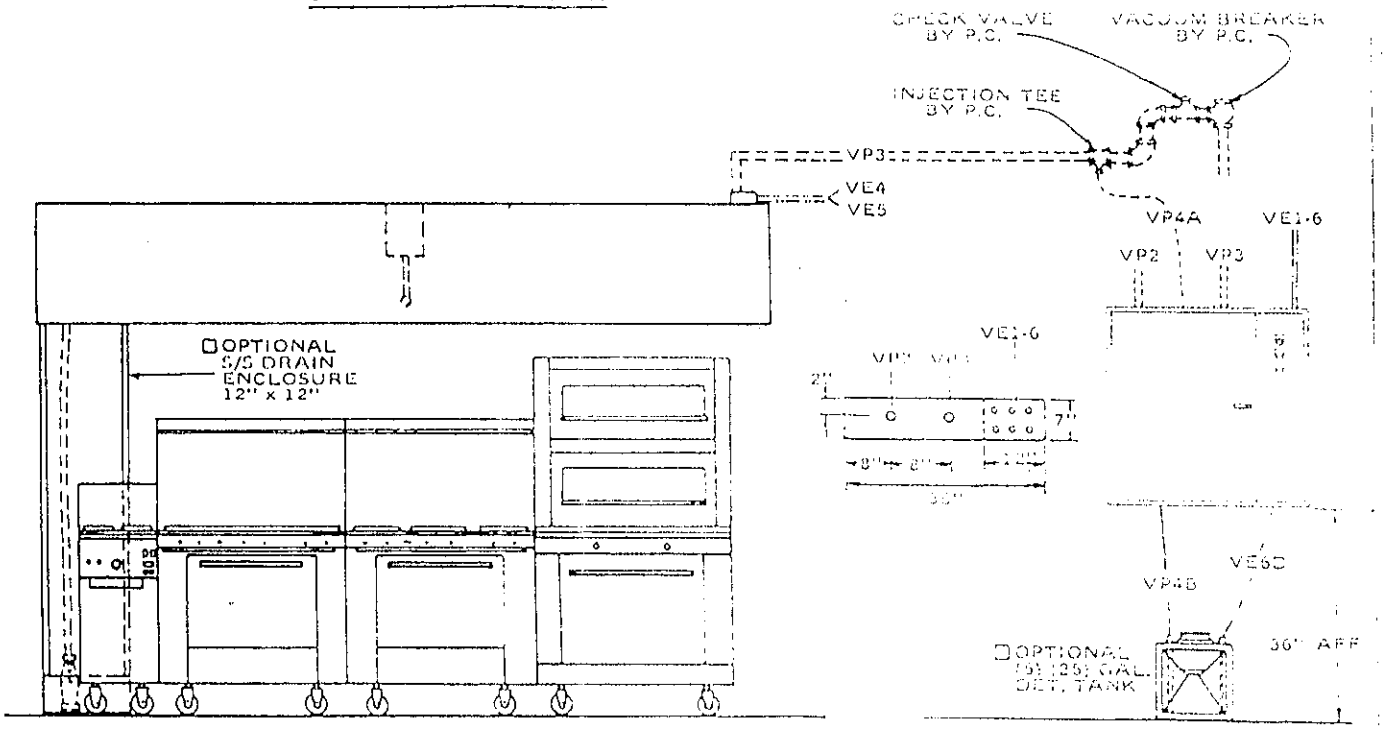
## DESIGN FEATURES

UL NSF

- Automatic Wash System shuts OFF fan and injects detergent and hot water into grease extractor chamber for up to ten minutes
- Optional Manual Fire Switch initiates fire quenching spray in plenum and activates fan to remove toxic fumes.
- Automatic Thermal Fire Detector initiates fire quenching spray in plenum, closes the damper to prevent fire from spreading to the ductwork and deactivates the fan.
- Optional Vent Light Switch may be conveniently mounted on control panel.
- Optional Low Level Detergent Alarm

AVTEC INDUSTRIES INC. 120 KENDALL POINT DR. OSWEGO, IL 60543 [630] 851-4800

## SERVICE CONNECTIONS



### ELECTRICAL CONTRACT

**BUILDING SERVICES**

VE1 ☐ 20A 120/1 control power supply
VE2 ☐ 20A 120/1 power supply for vent-lights.

**FIELD INTERCONNECTIONS**

VE3 ☐ 120/1 control circuit to fan magnetic motor controller, for exhaust (& supply) fan(s)
VE4 ☐ 20A 120/1 power from AVTEC panel to vent lights.
VE5 ☐ 120/1 to thermo detector damper box.
VE6 ☐ Provide (2W) field interconnects to (remote only)
- A ☐ Manual Pull Fire Switch
- B ☐ Wash Solenoid Valve 120 volt
- C ☐ Detergent Pump 120 volt
- D ☐ Detergent Sensor Probe 20vdc

**CONTROL CABINET SIZE**

Standard: 36" x 36" x 7" d

@25 psi (140°F for 3-5 min.)

### PLUMBING CONTRACT

**BUILDING SERVICES**

VP2 ☐ ____" hot water (140°F) to control panel (20 to 40 psi)

**FIELD INTERCONNECTIONS**

VP3 ☐ ____" hot water (140°F) to ventilator ____ places.
VP4 ☐ 3/8" Detergent tubing
- A ☐ From detergent pump to injection tee.
- B ☐ Injected in remote detergent tank.

**OPTIONAL**

VP7 ☐ 3/4" cold water to control panel.
VP8 ☐ 3/4" cold water to vent ____ places.

NOTE: Other required connections are shown on Ventilator Roughing Data Sheet.

IMPORTANT NOTE: The various trades' installation responsibilities must be included in their contracts.

## SPECIFICATIONS

Provide AVTEC U.L. Listed, NSF approved, (surface) (recessed) wall mounted Auto Wash Ventilator Control Panel, Model No. VCWW to operate AVTEC ventilator fan(s), wash cycle and internal plenum and duct collar fire protection system. Control panel to be 18 gage stainless steel and shall house all electrical and plumbing components.

Electrical components to consist of FAN START, FAN STOP/WASH START & RESET buttons, adjustable auto wash timer, 0 to 10 minutes, detergent pump prime switch, and thermal detector switch. RESET button to interrupt FAN ON or WASH ON modes.

Plumbing components to consist of ball type shut off valve, wye-strainer, pressure-temperature gage, shock absorber, solenoid valve, detergent pump and 2 gallon reservoir.

All components to be pre-wired and pre-plumbed ready for field connection by applicable trades.

### ACCESSORIES

- ☐ Provide illuminated STOP/START buttons.
- ☐ Provide (panel mounted) & (remote) manual pull fire switch.
- ☐ Provide vent light switch.
- ☐ Provide (integral 5 gal.) (remote 5 gal.) (remote 25 gal.) detergent tank (and pump).
- ☐ Low Level Detergent Indicator with Audio Alarm

### OPTIONAL

- ☐ Provide micro-switch in lieu of thermal detector to operate fan and wash spray in fire condition, upon signal from fusible link damper.

AVTEC INDUSTRIES INC. 120 KENDALL POINT DR. OSWEGO, IL 60543 FAX (630) 851-5777

MANUAL

# FIRE SUPPRESSION SYSTEMS DATA SHEET

# SPECIFICATIONS MODEL R-102

### Total System

The restaurant fire suppression system shall be the pre-engineered, liquid agent, cartridge-operated type with a fixed nozzle agent distribution network. It shall be listed with Underwriters Laboratories, Inc. (UL).

The system shall be capable of automatic detection and actuation with local or remote manual actuation. Accessories shall be available for mechanical or electrical gas line shut-off applications.

The system shall have fire suppression capabilities for the following restaurant hazard areas: ventilating structures including hoods, ducts, plenums, and filters; deep-fat fryers; griddles and range tops; upright, natural charcoal, or chain-type broilers; electric, lava rock, or gas-radiant char-broilers.

A system owner's manual shall be available containing basic information pertaining to system operation. A detailed technical manual shall be supplied including system description, design, installation, recharge, and maintenance procedures, plus accessory installation and reset instructions.

The manufacturer shall provide services through a network of authorized distributors.

### System Equipment

**Agent** – The extinguishing agent shall be a potassium carbonate, potassium acetate-based formulation designed for flame knockdown and securement of grease-related fires. It shall be available in plastic containers with instructions for liquid agent handling and usage.

**Tank and Bracket** – The liquid agent storage tank shall be stainless steel with a three gallon (11.4 L) capacity. The shell assembly shall meet the following pressure test requirements: 100 psi (690 kPa) working pressure, 300 psi (2069 kPa) test pressure, 600 psi (4137 kPa) minimum burst pressure.

The tank shall include an adaptor/tube assembly. The adaptor shall be chromium-plated steel with a 1/4-18 NPT female inlet and a 1/2-14 NPT male outlet. The pick-up tube shall be 304L stainless steel - 1/2 in. O.D. by .028 wall.

A welded steel bracket shall be provided for mounting the tank in a minimum amount of space. The agent tank shall be secured with hinged bracket bands.

**Discharge Nozzles** – Each discharge nozzle shall be tested and listed with the restaurant system for specific applications. Nozzle placement shall be determined by the size of the orifice in the nozzle tip. The nozzle tip shall be brass or chromium-plated brass, and stamped with the part number and flow rating. The nozzle tip retainer and body shall be chromium-plated brass. The nozzle strainer shall be brass with stainless 50 mesh screen. Each nozzle tip shall be covered by a protective blow-off cap.

**Regulated Release Mechanism** – The regulated release mechanism shall be the spring-loaded, mechanical/pneumatic type capable of providing the expellant gas supply to one or two agent tanks, depending on the capacity of the nitrogen cartridge used. It shall contain a factory-installed regulator deadset at 100 psi (690 kPa) with an internal relief of approximately 130-150 psi (896-1034 kPa). In the "armed" position, the main spring force to the puncture pin piston shall be 150 lb. (68 kg). The mechanism shall have a visual indicator of the cocked or fired condition without having to open the enclosure.

The regulated release mechanism shall have the following actuation capabilities: automatic actuation by a fusible link detection system; remote manual actuation by a mechanical pull station; local manual actuation by a push button located at the front of the release mechanism enclosure.

The regulated release mechanism shall be housed in a chromium-plated 16 ga. sheet steel enclosure with cover. The enclosure shall contain knock-outs for 1/2 in. conduit. The cover shall contain openings for the push button and visual indicator.

The regulated release mechanism shall be compatible with mechanical gas line shut-off devices; or, when equipped with a field or factory-installed solenoid and switch, it shall be compatible with electric gas line or appliance shut-off devices.

**Detection System** – The regulated release mechanism shall be compatible with a fusible link detection system.

The fusible link shall be selected and installed according to the operating temperature in the ventilating system. The fusible links shall be rated as follows:

| Fusible Link Temperature Rating | Use Where Operating Temperature Does Not Exceed |
|---|---|
| 280 °F (130 °C) | 225 °F (107 °C) |
| 360 °F (182 °C) | 290 °F (143 °C) |
| 450 °F (232 °C) | 360 °F (182 °C) |
| 500 °F (260 °C) | 400 °F (204 °C) |

The fusible link shall be supported by a detector bracket/linkage assembly. The detector bracket shall be 16 ga. cold-rolled stainless steel. The detector linkage shall be 20 ga. cold-rolled stainless steel.

The detector bracket/linkage assembly shall have provisions for connecting 1/2 in. rigid or EMT thin-wall conduit, and 1/16 in. (1.6 mm) diameter flexible stainless steel rope. Changes in the direction of the conduit and steel rope shall be accomplished with die cast aluminum alloy, 90° pulley elbows.

### Accessory Equipment

The following accessory equipment shall be available, and shall be compatible with the liquid agent restaurant fire suppression system.

**Remote Manual Pull Station** – If the release mechanism is not accessible for manual actuation, a remote manual pull station shall be provided as the primary means of manual actuation. The pull station shall be the glass break-rod type, and shall be connected to the release mechanism trip lever by means of a 1/16 in. (1.6 mm) diameter stainless steel rope and 1/2 in. conduit. The pull station shall be located at a distance of not more than 125 ft. (38 m) from the release mechanism. The mounting height of the pull station shall be in accordance with the authority having jurisdiction.

**Mechanical Gas Line Shut-Off Valve** – A UL listed, mechanical gas valve shall be provided when automatic gas line shut-off is required for indoor applications. It shall be adapted to the release mechanism cartridge receiver by means of a pneumatic piston-type air cylinder. The valve shall have resilient seating

steel internal parts. It shall be a two-way, normally-open valve requiring 4-15 lb. (1.8-6.8 kg) of pull force to trip. The valve (3/4 to 2 in.) shall have an external visual indicator of the closed or open position.

**Electric Gas Line Shut-Off Valve** – A UL listed, electric gas valve shall be provided when an electrical means of gas line shut-off is required for indoor applications. The gas valve shall incorporate an electric snap-action switch and a manual reset relay with its electric circuit for 110 VAC, 50/60 Hz or 24 VAC, 50/60 Hz. In 24 VAC applications, a transformer with the appropriate voltage rating shall be provided. The gas valve shall be constructed of aluminum with an operating temperature range of 32 °F to 120 °F (0 °C to 49 °C).

**Electric Switch** – A UL listed, electric snap-action switch shall be provided to shut off electrical power to appliances, or to activate electrically-operated devices. Depending on the application, the switch shall be either single-pole, double-throw; double-pole, double-throw; or four-pole, double-throw. The switch shall have a rating of 15 amps, 1/3 hp, 125 or 250 VAC with 1/2 amp at 125 VAC, or 1/4 amp at 250 VAC. A relay shall be supplied if the equipment load exceeds the rated capacity of the switch.

**Pressure Switch** – A UL listed, pneumatically-operated switch shall be provided to shut off electrical power to appliances, or to activate electrically-operated devices. The switch shall be connected to the release mechanism cartridge receiver utilizing 1/8 in. copper tubing and fittings. Depending on the application, the switch shall be single-pole, double-throw or double-pole, double-throw. The switch shall have a rating of 15 amps - 125, 250, or 480 VAC with 10 hp at 125 VAC "L", 1 hp-115 VAC, 2 hp-230 VAC; 1/2 amp at 125 VAC; or 1/4 hp at 250 VAC. A relay shall be supplied if the equipment load exceeds the rated capacity of the switch.

UL is a registered trademark.

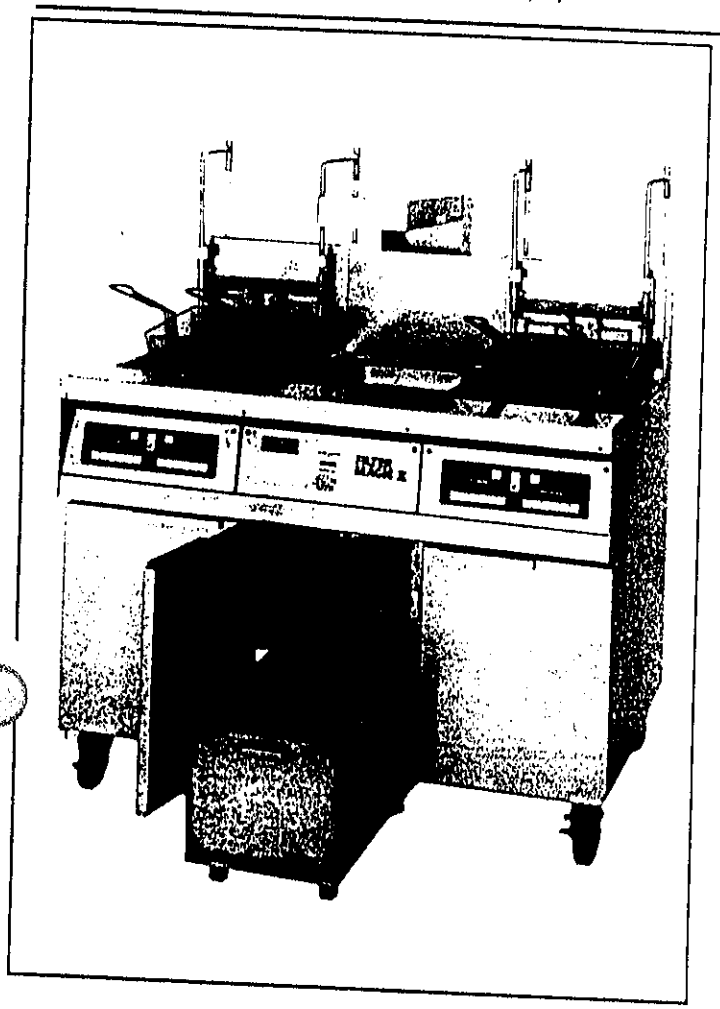
# FILTER MAGIC® SYSTEM
## For Gas and Electric Fryers
### MJH50, MJ35G, MJ45E, MJCFE, G18FB, G24FB, H14, H17, H22, H14TD, H17TD, H22TD



- Extends shortening life
- Fast, safe, easy to operate
- Automatic, hands-off filtration
- Convenient built-in, full-sized or undercounter filter cabinet

The Frymaster Filter Magic® System is specifically designed to extend shortening life. Filter Magic® does it fast, safely, simply; reducing operating costs and yielding a more consistent, higher-quality product.

Fifty pounds (28 litres) of oil can be automatically filtered completely in about three minutes, while other fryers in the system are still in use. Any fryer in the battery can be filtered without moving the filter from fryer to fryer.

The process is as easy as: 1. Switch off the fryer; 2. Open drain valve; 3. Start filter pump. No special training required, nothing hot or messy to handle. Filter Magic® automatically filters oil as Frymaster's exclusive Power Shower™ directs jets of hot oil down every inch of the frypot, flushing crumbs and sediment into the filtering system. After filtering, fresh oil is automatically pumped back into the frypot.

Filter Magic® is available in full-sized and undercounter cabinets that can be batteried to either side of most Frymaster gas and electric fryers. The full-sized cabinet can be purchased with cut-out for optional cafeteria-style or scoop-type pan and a rod-style or bulb-type heat lamp can be mounted to the cabinet, making a complete warming station.

Up to six of the following same Frymaster models can be batteried to each side of the Filter Magic System®: MJH50, MJ35G, MJ45E, H14, H17, H22, H14TD, H17TD. Up to four MJCFE, G18, G24 fryers can be batteried to each side of a Filter Magic System®.

## STANDARD FEATURES

- Power Shower™
- 1/3 H.P. Motor With 5.5 GPM
- Stainless Steel Inner and Outer Filter Pans
- Filter Heater
- Filter Screen
- Crumb Screen

## HOW TO SPECIFY

**FM-A** Full sized Filter Magic system to battery with MJH50, MJ35G, MJ45E, H14, H17, H22, EPH14, EPH17

**FM-B** Full sized Filter Magic system to battery with MJCFE

**FMU-A** Undercounter Filter Magic system to battery with MJH50, MJ35, MJ45E, H14, H17, H22, EPH14, EPH17

**FMU-B** Undercounter Filter Magic System to battery with MJCFE

**FB18/24** Full sized Filter Magic System to battery with G18FB and G24 FB

FILTER MAGIC CABINET CAN BE LOCATED ANYWHERE IN THE BATTERY --PLEASE SPECIFY.

### OPTIONAL ACCESSORIES

- ☐ Rod-style heat lamp assembly
- ☐ Bulb-style heat lamp assembly
- ☐ Cafeteria-style dump pan
- ☐ Perforated scoop-type dump pan
- ☐ Filter envelopes
- ☐ Casters
- ☐ Filter cover
- ☐ Stainless steel door, cabinet, sides

### STANDARD ACCESSORIES

- Filter paper (25 Ct.)
- Filter powder (100 1-cup applications)
- Filter brush
- Fryer's friend (cleanout rod)

### NOTES

- Supply voltage for filter is obtained from the line voltage of fryer, except for 480V, which will have a separate 120V, 60Hz (9.0 Amp) power supply cord supplied with unit.
- Control Voltage: 24V, 60Hz
- Export Supply Voltage: 220V, 50Hz (4.5 Amp)
- FB18 and FB24 not available for export
- Filter Magic systems are also available on fryers equipped with computers and/or automatic basket lifters.
- For applications where space is premium, please see Frymaster's FootPrint® Filtration specifications.

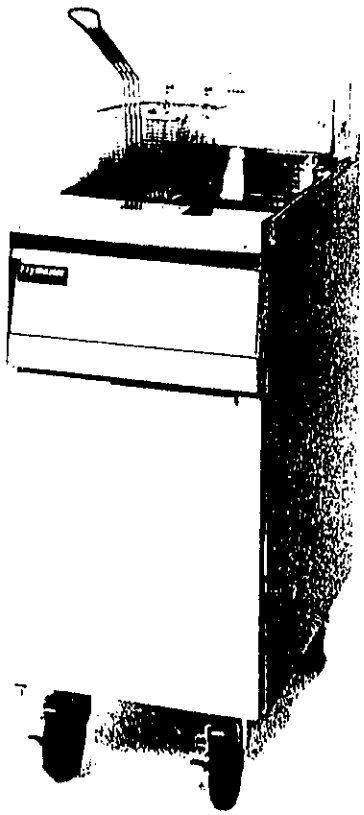
ITEM NO. #C12

# Frymaster®

A WELBILT Company

# MJ35 Gas Fryers

## Specifically designed for all-purpose frying



*Shown with optional casters*

- Open-pot design, no tubes, easy to clean
- Centerline thermostat, two-year limited warranty, quick response to loads, accurate to 1°
- Deep cold zone, 1-1/4 in. (32 mm) IPS ball-type drain valve
- Lifetime limited warranty on stainless frypot
- Multiple orifice burner, no burner tube radiants to burn out, no cleaning or adjusting air shutters

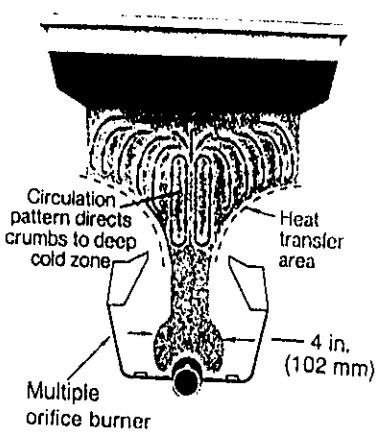
The MJ35 has a minimum 30-lbs. (15 litres)* and maximum 40-lbs. (20 litres)* shortening capacity. The frying area is 12 x 15 in. (305 x 381 mm). This 110,000 BTU (116 megajoules) model is specifically designed for all-purpose frying and produces 65 lbs. of french fries per hour -- frozen to done. The exclusive 1° action thermostat (two-year limited warranty) extends shortening life and produces a more uniformly-cooked product. Centerline thermostat mounting permits quick sensing of cold food placed in either basket. Unique Master Jet burners have no burner tube radiants to burn out. No burner cleaning or air shutter adjustment is required.

The open, stainless steel frypot has a large heat transfer area to fry more product per load. The open-pot design has no hard-to-clean tubes. Every inch of the frypot and cold zone can be cleaned and wiped down by hand.

The large cold zone catches crumbs and sediment from the frying area. These particles are trapped in the cold zone where they do not carbonize, contaminate shortening or cling to fried products.

The MJ35 model uses a millivolt temperature control circuit. The MJ35GBL automatic basket lift motor uses 120V (240V for export). Up to three MJ35 fryers can be batteried to produce a frying station.

*Liter conversions are for solid shortening @70°F.



*Unique frypot design with deep cold zone*

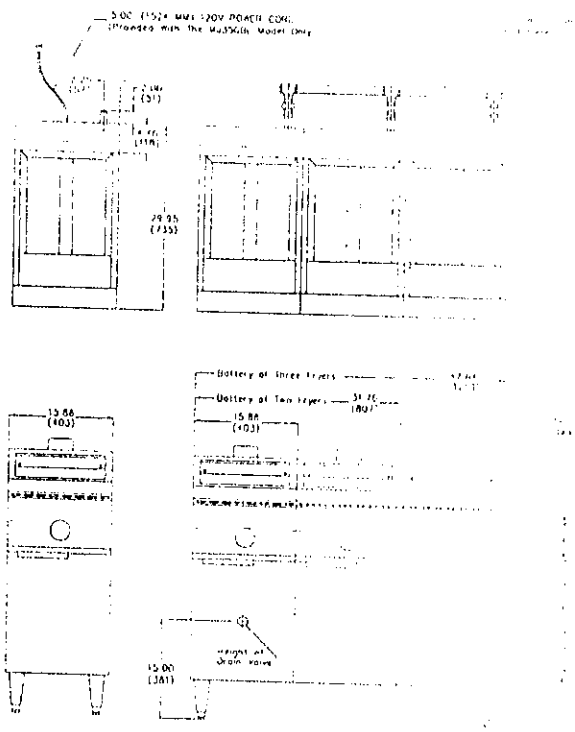
# MJ35 Gas Fryers



## DIMENSIONS

| MODEL NO. | SHORTENING CAPACITY | SIZE HEIGHT | SIZE WIDTH | SIZE LENGTH | DRAIN HEIGHT | NET WEIGHT | SHIPPING INFORMATION WEIGHT | CLASS | CUBE | DIMENSIONS H | DIMENSIONS W | DIMENSIONS L |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MJ35 and MJ35G | min.-max. 30-40 lbs. (15-20 litres) | 40.47" (1028 mm) | 15.88" (403 mm) | 29.95" (761 mm) | 12" (305 mm) w/extension | 145 lbs. (66 kg) | 177 lbs. (80 kg) | 85 | 19.47 | 42.50" (1080 mm) | 22" (559 mm) | 36" (914 mm) |
| MJ35GBL | min.-max. 30-40 lbs. (15-20 litres) | 42.29" (1074 mm) | 16" (403 mm) | 29.96" (769 mm) | 12" (305 mm) with extension | 185 lbs. (84 kg) | 233 lbs. (106 kg) | 85 | 19.47 | 42.50" (1080 mm) | 22" (559 mm) | 36" (914 mm) |

## POWER REQUIREMENTS

| MODEL NO. | NATURAL GAS | LP GAS | ELECTRICAL | EXPORT |
|---|---|---|---|---|
| MJ35 | 110,000 BTU input (116 megajoules) (32.2 kW) | 110,000 BTU input (116 megajoules) (32.2 kW) | none required for millivolt system | |
| MJ35G | 110,000 BTU (116 megajoules) (32.2 kW) | 110,000 BTU input (116 megajoules) (32.2 kW) | none required for millivolt system | |
| MJ35GBL | 110,000 BTU (116 megajoules) (32.2 kW) | 110,000 BTU input (116 megajoules) (32.2 kW) | For basket lift operator 120V/60Hz/7 AMPS 120VAC, 5' (1.5m) grounded power cord provided | 240V/50Hz 3-1/2 AMPS |

## NOTES

- 1/2" (NPT) gas inlet size on single fryers.
- 120VAC 5 ft. (1.5m) grounded power cord provided for MJ35GBL only.
- Gas supply line to fryers should be minimum 1/2" for single fryers, minimum 1" for 2 or more fryers in battery. Recommended minimum store manifold pressure to be 6" W.C. for natural gas and 11" W.C for L.P. gas. Check plumbing codes for proper supply line sizing to attain burner manifold pressure of 4" W.C. natural or 9" W.C. L.P.

## CLEARANCE INFORMATION

A minimum of 24" (610 mm) should be provided at the front of the unit for servicing and proper operation, and 6" (152 mm) between the sides and rear of the fryer to any combustible material. A minimum of 18" (457 mm) should be maintained between the flue outlet and the lower edge of the exhaust hood filters.

## HOW TO SPECIFY

| | |
|---|---|
| MJ35 | Millivolt fryer with concealed thermostat knob |
| MJ35G | Millivolt fryer with control panel with exposed thermostat knob |
| MJ35GBL | Automatic basket lift model (2 independent lifts with 0-15 minute timers and thermostat knob on control panel) Standard timers are 0-15 minutes |
| FM*35G | Up to 6 MJ35G fryers in battery with Filter Magic® system. (Filter available in any position. Please specify location.) |
| ST | Plain steel pot -- enamel cabinet (not available in battery) |
| SD | Stainless steel pot and door -- enamel cabinet |
| SC | Stainless steel pot, door and cabinet |

*Insert number of fryers in battery.

## OPTIONAL ACCESSORIES

- ☐ Frypot cover
- ☐ Sediment tray
- ☐ Flexible metal connector with quick-connect coupler
- ☐ Full size basket in lieu of twin baskets
- ☐ Fryer's Friend clean-out rod
- ☐ Screen-type basket support
- ☐ Fishplate
- ☐ 3/4" x 48" (19 x 1219 mm) quick disconnect with gas line and adapter
- ☐ 3/4" x 36" (19 x 914 mm) quick disconnect with gas line and adapter
- ☐ Automatic basket lifts (2 independent lifts with 0-15 minute electric timers)
- ☐ Stainless steel apron drain with basket (interchangeable right or left side)
- ☐ SF (Simmer Fry) hinged frypot cover (not available with MJ35 batteries)
- ☐ 0-15 minute mechanical timer (MJ35G only)

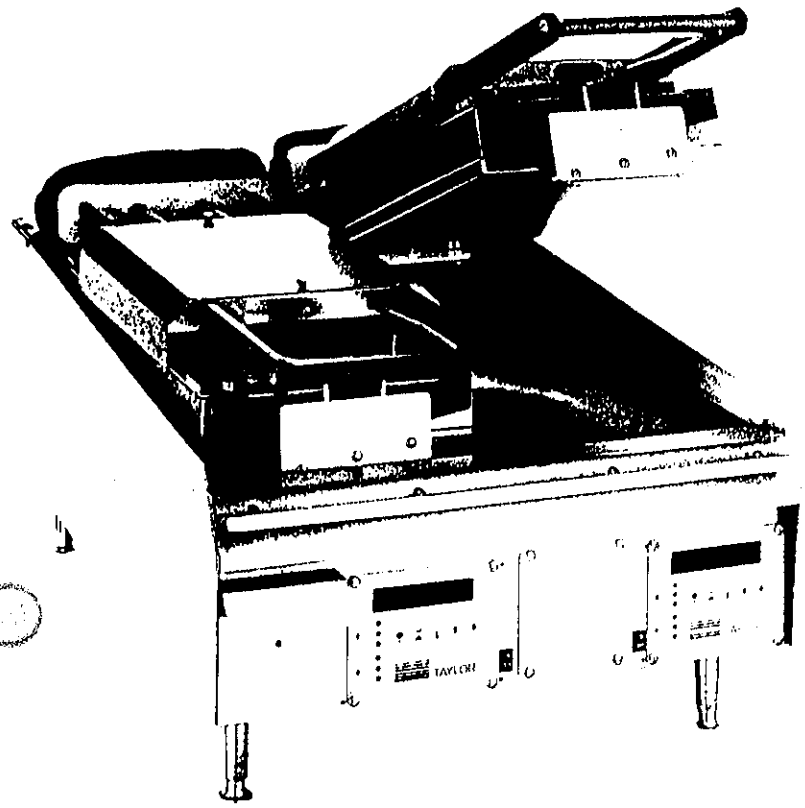
# Model QS24

Single Platen



The Taylor Model QS24, compact, countertop flat or clamshell grill is designed to deliver fresh, cook-to-order menu items...fast! The two sided cooking method is the reliable solution to increase speed of service, reduce product waste, and assure safe product integrity. And when multiple grills are installed side by side, cooking surface and capacities are greatly increased.

This modular design includes two independent 12" (30.5 cm.) wide cooking zones and one or two 11" (27.9 cm.) optional upper platens. The two-sided, contact cooking concept will cook the top and bottom of the product simultaneously. Product will be cooked-to-order and served to the customer in the least amount of time. And the grill responds quickly, returning to preset temperatures every time fresh or frozen foods are added to the grill surface.

Complete your menu with reliable equipment from Taylor — the new QS24, clamshell grill.

## QS (Quick Self) Quiz

Do you want to serve cooked-to-order products FAST? Yes No

Are quick recovery and reliable cooking temperatures, even during your busiest times important to your business? Yes No

Are you concerned that every grilled product served has achieved the proper internal temperature necessary for product safety? Yes No

**If you answered yes to one or more of these questions, the QS24 offers the solution.**

TAYLOR®

The Taylor world-wide distributor network offers the most complete line of equipment, factory trained service technicians, full parts inventory, merchandising programs, financing, and leasing capabilities to meet your needs. Your local distributor is a Taylor professional who can assist in planning your menu.

# Model QS24

## FEATURES

**Cooking Surface**
Two, 12" (30.5 cm.) wide, 24" (61.0 cm.) deep cook areas, 3 independent heating elements for each 12" (30.5 cm.) of cook surface width. Assures even temperatures and quick recovery.

**Control Board**
Programmable microprocessor controls makes menu selection simple and includes a self-diagnostic feature for serviceability.

**Temperature Controls**
Two individual temperature controls can be set from 150°- 425°F (65.5°- 218.3°C). Left and right side operate independently for menus that require items with varied temperatures.

**Indicator Light**
Lights illuminate when heaters are ON.

## OPTIONS

The modular design can be ordered as a flat grill, one upper platen or two. If one upper platen is required, it can be located on either the left or right hand cook surface.

**Upper Platen (optional)**
Each platen has a cooking surface of 11" x 20" (27.9 cm. x 50.8 cm.). Three individually controlled heaters. Platen can be positioned from 30° to a maximum angle of 60° from cooking surface to accommodate various height locations of existing hood.

**Release Material**
Release material completely covers and protects upper platen cooking surface. Attachment ensures that the release material stays in place throughout the day for easy cleaning and will minimize carbon build-up.

## SPECIFICATIONS

**Clearance**
3" (7.6 cm.) from all combustible materials and 3" (7.6 cm.) of air clearance in rear.

**Dimensions**
Width: 24" (60.9 cm.)
Depth: 35-1/2" (90.2 cm.)
Height: 15-1/4" (38.7 cm.) to top of back splash. 20" (50.8 cm.) with optional upper platen lowered.
Counter Clearance: mounted on 4" (10.2 cm.) adjustable legs.

| Electrical | One dedicated connection. | | |
|---|---|---|---|

# An Amana Classic: Heavy Duty Stainless Steel, Full Sized, Full-Featured.

- **Versatile Value**
  Amana's RFS series of ovens feature the largest capacity in their class. A large 1.2 cubic foot interior and a superior cooking pattern allow you to prepare a greater variety of menu items.
- **Durable and Dependable**
  This series is designed for use in most medium to high volume foodservice locations. A stainless steel interior and exterior and a heavy duty interlock switch are only two reasons the RFS series has a strong and loyal following.
- **Unbeatable Security**
  A full 3-year warranty on parts, labor and travel provides maximum protection and is backed by over 700 fully trained and factory authorized service contractors across North America.
- **Easy-to-Clean**
  Our exclusive sealed-in shelf is only one example why Amana Commercial products are easy-to-maintain, easy-to-use and easy-to-own.
- **Double the Simplicity**
  A X2 quantity pad simplifies operation and training and improves product quality consistency when preparing more than one order at a time.
- **Easy-to-Train, Flexible Menu**
  Programmable selection of up to 100 menu items ensures fast, consistent operation. Pads can be preset by power level and time for fast, consistent operation. 5 power levels, from full power to hold, provide flexibility for heating a wide variety of food items from frozen to fresh.

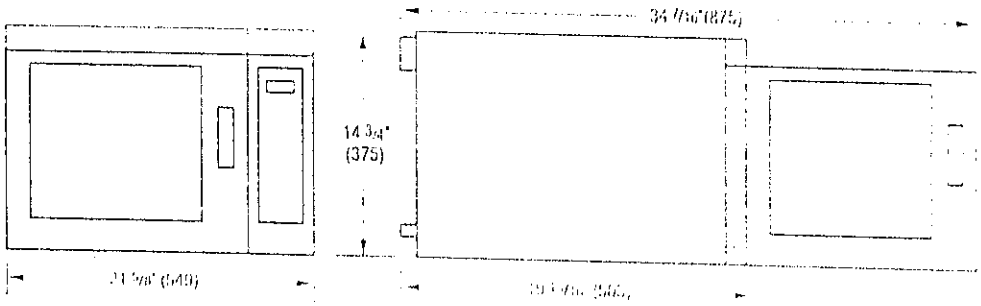
Amana's continuing commitment to quality products may mean a change in specifications without notice.
* Microwave output power ratings based on IEC 705 test



TO SPECIFY AN AMANA RFS12MPS COMMERCIAL RADARANGE MICROWAVE OVEN:
Oven shall be certified to have been designed and tested for compliance to the applicable U.S. Government Department of Health and Human Services performance standards for microwave ovens. Electrical controls for the oven shall consist of a touch control panel featuring single and multiple program preset timing methods, variable entry timing, five power levels and time programming options. Programming shall be all electronic and shall not require tools. There will be no need to pull out the timer panel, match wires and post or adjust screws. There shall be 10 numbered pads, a digital readout display and START, STOP/q 62RESET, TIME ENTRY, DEFROST, HOLD, MED-HI, MEDIUM power and X2 pads. The oven shall have "instant-on" operation to provide microwave energy for the entire time selected. A "Permanent" memory shall lock in programming instructions even if power is disconnected for years. No batteries shall be used. There shall be built-in thermal protection. Oven interior shall be of top feed design with an enclosed rotating microwave antenna that distributes microwaves evenly. The side-swing door will have a see through window and shall be intrusion-proof with a slotted chase seal plus 3 interlock safety switches. Oven shall meet the standards and carry labels of NSF, U.L., and CSA. Oven shall have a five-foot power cord with 3-prong plug. Oven shall have a three-year warranty.

## Front-Breathing Self-Contained Compact Salad Top Refrigerators

### Short Form Specifications

**Exterior top** is one-piece 22-gauge stainless steel with integral 2.12" (5.1cm) square nosing at the front. Top has openings to accept 8 or 12 1/6-size 4"- 6" (10.2cm - 15.2cm) deep plastic pans. Adapter bars and 1/6 pans are supplied by Delfield. Temperature in top opening to maintain 33°F (1°C) to 41°F (5°C), with pans recessed 2.5" (6.4cm) at 86°F ambient room temperature, meeting NSF 7 requirements. One 60" x 10" x .5" (152cm x 25.4cm x 1.3cm) plastic cutting board is mounted on the the top at the front edge.

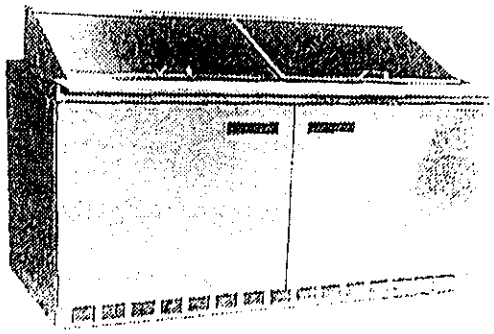
**Exterior back and bottom** are two-piece 24-gauge galvanized steel. Exterior ends are stainless steel.

**Interior sides** are thermoformed ABS plastic with shelf supports. Base is fully insulated with high-density foamed in place polyurethane.

**Refrigeration system** uses HFC-404A refrigerant. Compressor is 1/2 H.P., with condenser coil and condensate evaporator mounted on rear of the cabinet. Evaporator coils and temperature control are located on the interior rear wall of the cabinet. Refrigerant flow is controlled by a capillary tube. Cabinet maintains an interior cabinet temperature of 36°F to 40°F (2°C to 4°C).

**Electrical connections** are 115 volt, 60 Hertz, single phase. Unit has an 8' (2.4m) long electrical cord and NEMA 5-15P plug.

**Casters:** Equipment is mounted on 2" (5.08cm) diameter casters, with front three locking. Equipment clearance above the floor is 2.5" (6.35cm).



Model 4460N-12

### The following applies to two door models only

Doors have a 22-gauge stainless steel exterior, with thermoformed ABS plastic interior liner. Cabinet has one adjustable epoxy-coated wire shelf per door opening.

### The following applies to four drawer models only

Drawer fronts have a 22-gauge stainless steel exterior, with thermoformed ABS plastic interior liner. Drawer frames and slides are 14-gauge stainless steel, with stainless steel bearings. Each section has two drawers. Each top drawer holds one full size 12" x 20" (30.5cm x 50.8cm) pan 4"- 6" (10.6cm - 15.2cm) deep. Each bottom drawer holds one 12" x 20" (30.5cm x 50.8cm) pan 4" (10.6cm) deep. Pans supplied by others.

### Optional Accessories and Modifications

- Flat lift off covers
- 4" x 2" stainless steel backsplash
- 18" wide single tier overshelf
- Stainless steel back
- Plastic laminate on front
- Additional wire shelves
- Door lock
- *220V/50 Hertz electrical system

*Inclusion of this option will alter electrical specifications of the unit.

# Ranserve HTD Series Hot Food Well Units

Randell

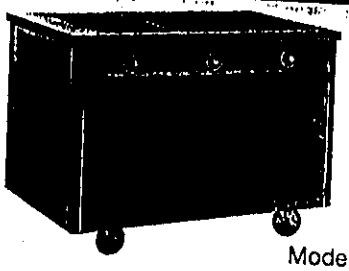
RanServe By Randell

PROJECT # C17

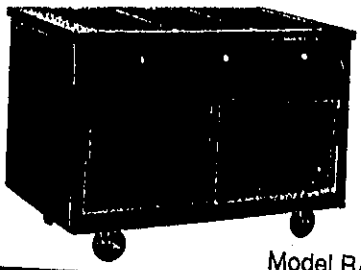
ITEM # QTY.

DATE

## Hot Food Well Units



Model RAN HTD-3



Model RAN HTD-3S

Portable, stainless steel heated serving station. Individually and thermostatically controlled 12" x 20" die-stamped hot food wells with drains and gate valve. Available in enclosed, dry storage or heated bases. Interchangeable stainless steel, or laminate body panels, snap together locking device designed to work with all other Ranserve equipment. Provided with 4 swivel casters-(2) locking.

## Models ■ HTD Series ■ HTD "S" Series ■ HTD "B" Series

### STANDARD FEATURES:

- Thermostatic control for precise food temperatures.
- Die-stamped raised sanitary rim pan oponings.
- Interchangeable body panels.
- "Bayonet" locking system to align and hold unit together with other Ranserve units if needed.
- 1" drain, manifold, and ball valve.
- Swivel casters - (2) locking.

### SPECIFICATIONS:

**UNIT TOP:** Top to be one piece of die-formed 16 gauge stainless steel with 1 1/2", 90° nosing on all sides. 12" x 20" top openings with raised die-stamped perimeters.

**FOOD WELLS:** Unit fitted with complement of 12" x 12" x 6 1/2" electrically heated food wells, individually and thermostatically controlled. 1" drains, drain manifold and common ball valve installed as standard - drain lines run to accessible area.

**UNIT BODY:** HTD Series (Buffet style with enclosed base); One end of unit to be fitted with female, spring loaded openings and the other end to be fitted with male " bayonet" fittings to align and hold units in place when two or more modular units are joined. Body frame to be all welded construction of steel with exposed corners to be 1 1/4" stainless steel. All corners welded and polished. Body ends and panels to be plastic laminate with galvanized steel backing (specify laminate color). Body ends and panels to be removable to allow the changing of colors. Unit to be equipped with 4 swivel casters, (2) locking, that are recessed inside of toe area. Unit shipped with 9'- cord & plug installed.

**CONTROLS:** Controls mounted on front of recessed stainless steel panel. Connections to heating elements to be located outside of heated zone to avoid wiring deterioration. Individual food wells wired to a common junction box(es). 120, 208, or 240V operation.

**HTD "S" series** (Cafeteria style with ***dry storage*** below) Same spec as HTD series only "S" series units to have (2) self-closing, sliding doors on one side below control panel. Doors mounted on overhead track assembly with stainless steel ball bearings. Doors to be stainless steel construction with plastic laminate exterior. Interior shelf to be 22 gauge stainless steel with integrally welded steel underbracing.

**HTD "B" series** (Cafeteria style with ***heated storage*** below) Same spec as HTD "S" series units only "B" series units to have a thermostatically controlled, electrically heated base with hinged doors and tray racks. Specify voltage. (NSF approved for food storage).

# Star Has a New Angle To Roller Grill Profits...

### *Breakfast sausages, hot dogs, and more are prepared best on a Star Grill-Max roller Grill!*

Star is pleased to offer the Star Grill-Max™ line of roller grills taking presentation and performance to its fullest potential morning, noon, and night.

**Features/Benefits:**

- ★ Unique stadium seating slanted roller design providing the best presentation of your products increasing sales and impulse purchases.
- ★ Slim-line design provides more grill surface in the same space. Increased capacity means additional sales and greater profits.
- ★ Latest technology in cooking and holding. Infinite temperature controls provide more linear heat control for better performance.
- ★ Easy access control knobs provide sectional heating for front and rear rollers.
- ★ Exclusive Duratec coated non-stick rollers, the best non-stick high performance coating for today's high volume operations. Duratec rollers meet the demands for improved durability, cleanability and feature superior grip for improved rollability of today's new Roller Grill snack foods.
- ★ The standard chrome rollers provide a durable cooking surface designed for traditional cooking operations.
- ★ Seal-Max, Star's exclusive superior heavy-duty roller bearing and seal combination provides smoother operation, longer life, low maintenance and grease-free internal compartments.

**Applications:**

Not only do Star Roller Grills, Bun Warmers and Sneeze guards combine to make the leading "Hot Dog Center" in the industry, but these versatile units can be used for breakfast sausages as well. These units, available in a variety of styles and sizes, are perfect for use in snack bars, convenience stores, recreational facilities, stadiums and virtually any venue where fast food is sold.

**Construction:**

Constructed of all stainless steel utilizing Duratec non-stick coated rollers or chrome rollers with tubular incoloy sheath elements. Infinite temperature controls for cooking and holding from low to high temperatures. Heavy-duty motor provides 360° rotation of rollers. Stadium seating of rollers provides a slope of 3° to 5° for better merchanding. Star incorporated its exclusive Seal-Max seal and bearing combination. Pilot light included and 120V units have a 6' cord and NEMA 5-20P, and 208/240V units NEMA 6-15P.

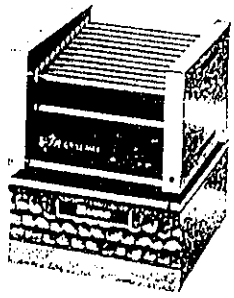
**Accessories:**

- ★ Optional merchandising door to increase merchandising opportunities and conceal the control panel.
- ★ High impact graphics are available to increase product awareness and build impulse sales.
- ★ Bun warmers and bun boxes. Bun warmers have thermostatic controls providing precise temperature control from 80° to 200°F.
- ★ Sneeze guards are formed polycarbonate and meet health department requirements.

**Warranty:**

Star's Grill-Max and Grill-Max Pro are covered by a one year parts and labor warranty.

**Models 20 and SST20**



**Models 50S and SST50 with Sneeze Guard**

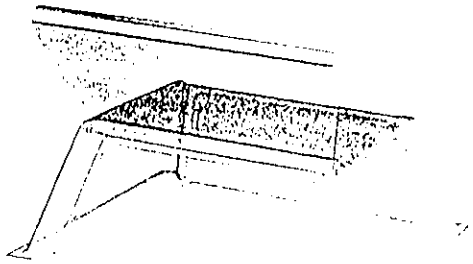
# Sneeze Guards

## Features/Benefits:

- ★ Ultra clear plastic provides clear and appetizing view of products.
- ★ Easy installation - fits tightly on sides of Roller Grills - no tools required.
- ★ Maintain cooking and warming temperatures more evenly.
- ★ One and two door styles available for use as operator only or self-serve applications.
- ★ Models are available to fit all new and old style roller grills with the exception of the model 40 and 12.
- ★ UL sanitation and safety approved - Meets Health Department requirements.
- ★ Heavy-duty polycarbonate material for years of maintenance free service.
- ★ Pass thru styles available.

**Model 30SG-1D**



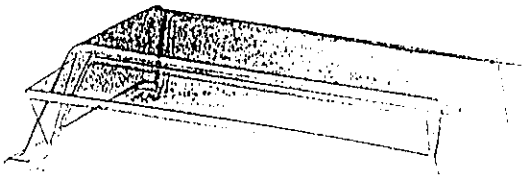
## Applicatons:

These sneeze guards are designed to fit our new style Star Grill-Max roller grills and the old style roller grill models. Complete your needs by adding a sneeze guard to protect your products.

## Construction:

Star's line of sneeze guards are constructed of 3/16" thick formed polycarbonate for easy maintenance free service.

**Model 45SG-FCA with optional SGS Sneeze Guard Shields**



## Warranty:

Sneeze Guards are covered by Star's one year parts and labor warranty.

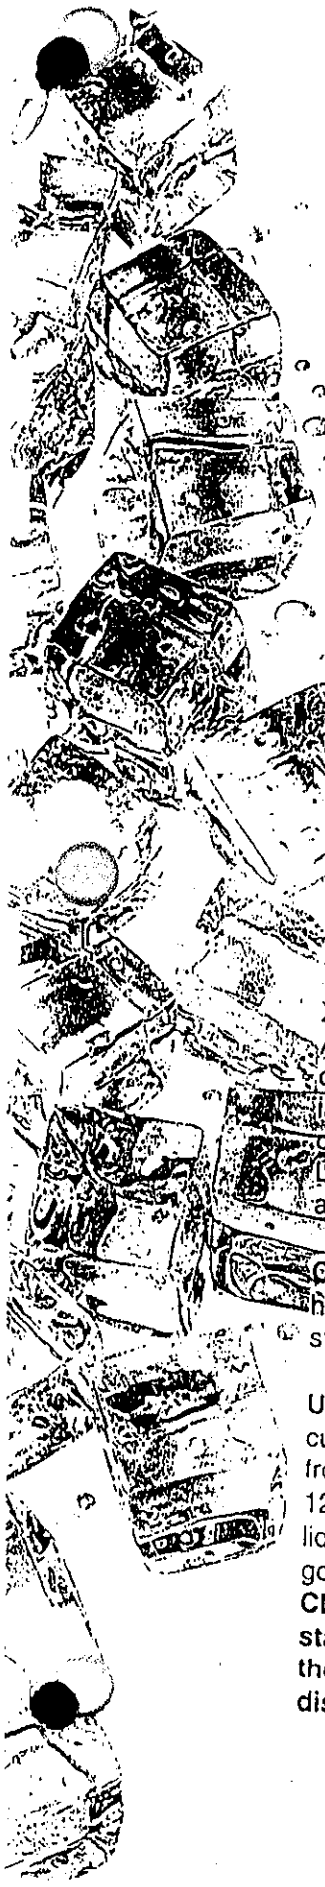
Note: Sneeze Guard Shields can be added to two door models to create a pass through model. Dimensions will increase slightly in the depth of the unit.

### Typical Specifications

Sneeze Guard is constructed with 3/16" formed polycarbonate. Units are UL - Sanitation Classified to NSF Std. #4 approved. Prices in the U.S.A.

# SERVEND
## Ice & Beverage Systems



SerVend cup dispenser cabinets are manufactured in durable stainless steel and have cup tubes which are adjustable to accommodate various size cup diameters. (Cup diameter spec list on back of this sheet.)

Removable plastic tops allow ease of cleaning.

**Cup Dispenser Features**
You can tell the features of the cup dispenser by the letters and numbers used for cup dispenser model numbers. Cup dispenser model numbers are:

| | | |
|---|---|---|
| CD2A-C | CD3A-C | CD4X-C |
| CD2X-C | CD4A-C | CD4U |

CD is Cup Dispenser.
2, 3 or 4 refers to the number of cup storage tubes in the cup dispenser.

**A (Gravity fed cup storage tube)** – The cup storage tube is positioned at approximately a 45 degree angle and cups slide forward by gravity. Gravity fed cup tubes can be filled from the rear or front of the cup dispenser.

**X (Spring loaded cup storage tube)** – A heavy spring kit in the back of the cup tube keeps cups pushed forward in the cup storage tube. Spring loaded cup tubes are filled from the front. Light spring kits for styrofoam cups are available as a factory option.

**C ("C" top)** – Cup dispenser top for high volume lid, straw and napkin storage. Removable plastic top.

**U (Universal cup tube)** – Each CD4U cup storage tube can hold any cup size from 3 5/8" - 4 5/8" in diameter (approx. 12-44 oz. cups). The CD4U has unique lid and straw storage compartments good for high volume applications. The **CD4U cup dispensers are not free standing, they must be mounted to the side of MD Series ice/beverage dispensers via the drain pan pin.**

| CD4U | High volume lid and straw storage. Four cup tubes (approx. 12-44 oz. cups 3 3/8" - 4 5/8" cup diameter).<br>Maximum 3 7/8" diameter for styrofoam cup.<br>No special cup tube sizes available.<br>12 3/4" W x 22 1/2" D x 32" H / 32.4 W x 57.1 D x 81.3 H (cm) | 38 lbs. / 17 kgs. |

**Special: An additional list price of $195 applies to any order placed with a non-standard cup tube set. Non-standard, "special" cup dispensers are NOT subject to cancellation.**

**Options (Gravity Feed Only):**

| | | |
|---|---|---|
| 01-012-01LT | Light spring kit for gravity cup tubes (per tube).<br>For styrofoam cups | 2 lbs. / 1 kg. |
| 01-012-01HY | Heavy spring kit for gravity cup tubes (per tube).<br>For paper cups and plastic cups | 2 lbs. / 1 kg. |

**Cup Tube Sizing Guide:**

To determine which cup dispenser tubes fit your cup sizes, measure the diameter of the top of your cups. Because of various cup heights, cup ounce size is not an accurate sizing guide for cup dispenser tubes.

**SerVend Warranty**

Two years limited parts warranty. One year limited labor warranty. Optional third year extended customer care warranty. Call local distributor for details.

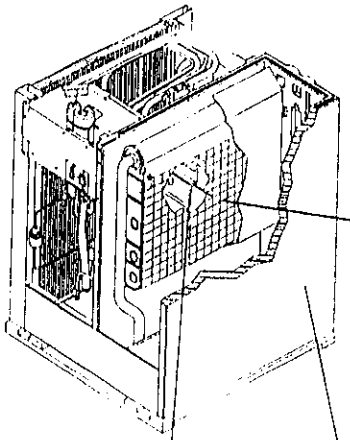
ECP 500 shown on model B-42 Bin

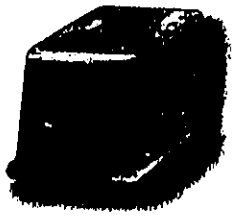
## ECP 500

**Produces up to 553 lbs. (251 Kgs.)* of ice per day.**

- Slim 22" (559mm) wide plastic cabinet is corrosion-proof.
- Most advanced "Harvest Assist" system gets ice to the bin quicker. It conserves energy and increases compressor life.
- Easy to service and install. The ECP Series machines have electro-mechanical controls.
- Works on all standard industry dispensers and bins.
- Environmentally responsible. All ECP Series machines use R-404A, an approved, non-ozone depleting refrigerant.
- Proven "classic cube" shape. Half cube and Full cube systems available.
- Available with an air- or water-cooled condenser.



Half Cube
7/8" x 7/8" x 3/8"
(22mm x 22mm x 10mm)



Full Cube
7/8" x 7/8" x 7/8"
(22mm x 22mm x 22mm)

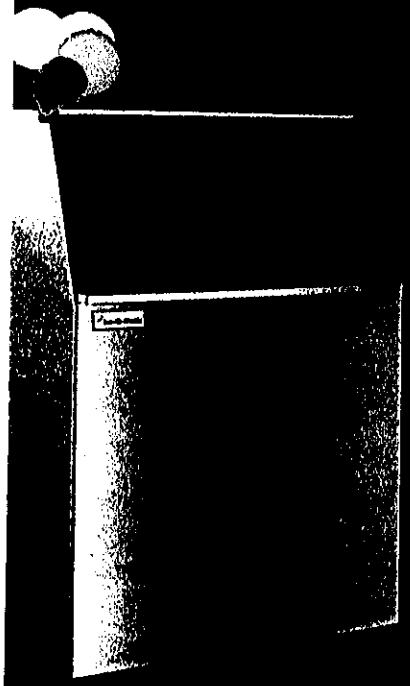
# B Series storage bins



**B55**
**Storage Bin**

50 years of quality and innovation

## Storage capacity from 255 lbs. (116 Kgs.) to 1866 lbs. (846 Kgs.).

- Dependable storage for either cube ice or flake ice.
- Use with ICE, GC or EMF Series ice makers.

B25 to B100

- Insulated on all sides and bottom with foamed-in-place polyurethane. Non-corrosive bin liner and molded plastic door.
- Stainless steel exterior (except B25 which has polyethylene molded exterior and interior).
- 6" to 7" (152 to 178mm) adjustable NSF approved legs.
- Bin drains are located at the rear of cabinet.

B120 to B170

- "SP" models have all stainless steel front and side panels, and galvanized back and bottom.
- "SS" models are all stainless steel: front, back, bottom, top and sides. All stainless steel is 300 series.
- All welded stainless steel door frame with all stainless steel, fully insulated, and gasketed door, providing a completely sanitary seal. Hold-open clips provided for convenience when using door.
- Roto-molded snout is dent and scratch resistant. The snout clips to bin front for convenience and safety. It can be easily removed for shoveling ice and cleaning.
- Sliding plastic view window provides access for ice breakup.
- Bin liner is polyethylene. Foamed-in-place insulation is 2" (51mm) thick on bottom and 1-1/2" (38mm) on walls, providing maximum ice preservation.
- 6" (152mm) adjustable black metal legs standard.

## Supremacy Series® Solid Door Reach-In Refrigerators and Freezers

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments. Units mounted on 6" (15.24cm) legs.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Doors on refrigerated units are constructed with double-pane tempered thermopane glass. Doors on freezer units are constructed with double-pane low E, Argon filled tempered thermopane glass. Door frames are constructed with a combination of extruded aluminum/PVC, and are provided with magnetic, gaskets. Doors will have self-closing hinges and continuous handle along vertical dimension of door(s). Glass door constructed to eliminate need for heater wires.

- Please specify right or left hand hinging at time of order.

Mechanical controls shall be located behind a removable shroud facing.

**THE FOLLOWING APPLIES TO REFRIGERATORS ONLY**

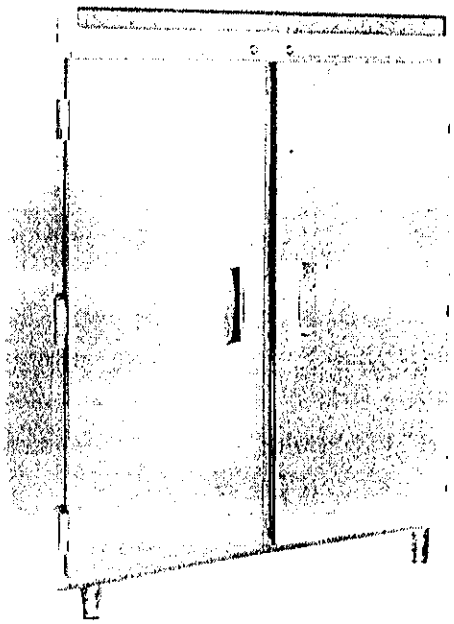
Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall be coated to prevent corrosion. Cabinet shall maintain 34°F to 40°F (1°C to 4°C) internal temperature.

**THE FOLLOWING APPLIES TO FREEZERS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall have deep-corrugated, staged fin construction for maximum efficiency with fewer defrost cycles. Cabinet shall maintain −10°F to 0°F (-23°C to -18°C) internal temperature.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.



MODEL SRR2-S

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.

Remote units are supplied with 6" stainless steel legs and J-box for field connection.

**OPTIONS & ACCESSORIES**

- Stainless steel backs
- Laminate on doors & ends
- Additional shelves and bridges
- Tray slides
- Kick panels
- Half-size hinged glass or stainless steel doors, two doors per section
- Remote refrigeration
- Correctional Facilities package
- ERC-2 microprocessor - based controls
- 4" Casters

**EXTERIOR / INTERIOR**

Cabinet exterior sides, front, and shroud shall be 22-gauge stainless steel. Facing of shroud shall be easily removable without the use of tools.

Cabinet interior shall be 22-gauge stainless steel. Bottom & top of liner shall be die-stamped to provide radius corners and a recessed bottom. Base shall be fully insulated with high-density foamed in place polyurethane.

Interior shall have 3 chrome-plated wire shelves per door section. Shelf support pilasters shall be heavy-duty stainless steel, with shelves adjustable at 1" (2.5 cm) increments. Units mounted on 6" (15.24cm) legs.

**DOORS**

Solid doors shall have a 22-gauge stainless steel exterior & interior liner, & shall be fully insulated with high density foamed in place polyurethane. Each door shall have 3 self-closing, cam-lift style hinges. Doors shall be easily removable without use of tools. Door gaskets shall be magnetic snap-in style to allow simple replacement. Door handles shall be recessed.

Doors on refrigerated units are constructed with double-pane tempered thermopane glass. Doors on freezer units are constructed with double-pane low E, Argon filled tempered thermopane glass. Door frames are constructed with a combination of extruded aluminum/PVC, and are provided with magnetic, gaskets. Doors will have self-closing hinges and continuous handle along vertical dimension of door(s). Glass door constructed to eliminate need for heater wires.

- Please specify right or left hand hinging at time of order.

Mechanical controls shall be located behind a removable shroud facing.

**THE FOLLOWING APPLIES TO REFRIGERATORS ONLY**

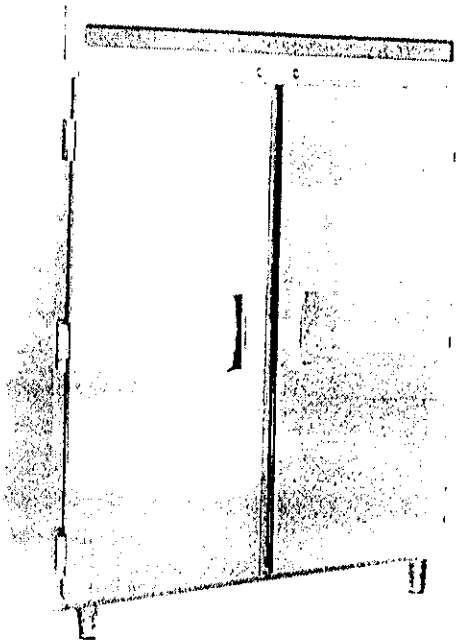
Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall be coated to prevent corrosion. Cabinet shall maintain 34°F to 40°F (1°C to 4°C) internal temperature.

**THE FOLLOWING APPLIES TO FREEZERS ONLY**

Refrigeration system shall use R404A refrigerant. System shall be completely outside food zone to maximize internal storage space. System shall utilize a dual diversion high flow air distribution system, and shall be a high capacity design with thermostatic expansion valves. Evaporator coils shall have deep-corrugated, staged fin construction for maximum efficiency with fewer defrost cycles. Cabinet shall maintain -10°F to 0°F (-23°C to -18°C) internal temperature.

**SINGLE VOLTAGE MODELS ONLY**

Electrical connections shall be 115 volt, 60 hertz, single phase, with an 8 ft (2.4m) long electrical cord & plug as shown on reference chart. Cord & plug shall be wired to the junction box on top of the unit.



MODEL SRR2-S

**DUAL VOLTAGE MODELS ONLY**

Electrical connections shall be 115/208-230 volt, 60 hertz, single phase, and must be hard-wired to the junction box located on top of the unit.

Remote units are supplied with 6" stainless steel legs and J-box for field connection.

**OPTIONS & ACCESSORIES**

- Stainless steel backs
- Laminate on doors & ends
- Additional shelves and bridges
- Tray slides
- Kick panels
- Half-size hinged glass or stainless steel doors, two doors per section
- Remote refrigeration
- Correctional Facilities package
- ERC-2 microprocessor - based controls
- 4" Casters

Army Corps of Engineers does not guarantee, certify, or ensure performance of any products, systems, strategies, or technologies described in the Sustainable Project Rating Tool (SPiRiT).

## U. S. Green Building Council Disclaimer

The LEED Green Building Reference Guide™ 2.0 is the second edition, support document for the LEED Green Building Rating System™. These LEED™ documents were developed by the U.S. Green Building Council, under contract number DE-FG36-97GO10268, for the U.S. Department of Energy, Energy Efficiency and Renewable Energy, Office of Building Technology, State, and Community Programs, and are intended for use by commercial building project stakeholders or project team members as a guide for green and sustainable design. They were prepared with the assistance and participation of representatives from many organizations. The views and opinions expressed represent general consensus and available information, but unanimous approval by all organizations is not implied. The views and opinions expressed also do not necessarily state or reflect those of the United States government.

Together, the LEED™ documents represent the U.S. Green Building Council's efforts to develop a standard that improves environmental and economic performance of commercial buildings using established and/or advanced industry principles, practices, materials and standards. They are subject to change from time to time in the future.

The U.S. Green Building Council authorizes you to view the LEED Green Building Reference Guide™ 2.0 for your individual use. In exchange for this authorization, you agree to retain all copyright and other proprietary notices contained in the original LEED Green Building Reference Guide™ 2.0. You also agree not to sell or modify the LEED Green Building Reference Guide™ 2.0 or to reproduce, display or distribute the LEED Green Building Reference Guide™ 2.0 in any way for any public or commercial purpose, including display on a web site or in a networked environment. Unauthorized use of the LEED Green Building Reference Guide™ 2.0 violates copyright, trademark, and other laws and is prohibited.

Please note that the text of the federal and state codes, regulations, voluntary standards, etc. reproduced in the LEED Green Building Reference Guide™ 2.0 is either used under license to the U.S. Green Building Council or, in some instances, is in the public domain. All other text, graphics, layout, and other elements of content contained in the LEED Green Building Reference Guide™ 2.0 are owned by the U.S. Green Building Council and are protected by copyright under both United States and foreign laws.

Also please note that none of the parties involved in the funding or creation of the LEED Green Building Reference Guide™ 2.0, including the U.S. Green Building Council, its members or the United States government make any warranty (express or implied) or assume any liability or responsibility, to you or any third parties for the accuracy, completeness or use of, or reliance on, any information contained in the LEED Green Building Reference Guide™ 2.0, or for any injuries, losses or damages (including, without limitation, equitable relief) arising out of such use or reliance.

As a condition of use, you covenant not to sue, and agree to waive and release the U.S. Green Building Council, its members and the United States government from any and all claims, demands and causes of action for any injuries, losses or damages (including, without limitation, equitable relief) that you may now or hereafter have a right to assert against such parties as a result of your use of, or reliance on, the LEED Green Building Reference Guide™ 2.0.

SPiRiT Comment Sheet ..... 22

# NOTES

1) This Sustainable Project Rating Tool (SPiRiT) is derived from The U. S. Green Building Council LEED 2.0 (Leadership in Energy and Environmental Design) Green Building Rating System ™.

2) The SPiRiT numbering scheme parallels, but does not match LEED 2.0. LEED does not number major sections, which it calls 'Credit Categories,' ex. 'Sustainable Sites,' rather it numbers criteria or 'credits' within each major section. SPiRiT credit numbers match those of LEED where there is a 1:1 comparison. Where additional credits have been added they fall at the end of major sections.

3) The SPiRiT Credits all follow the format: Intent, Requirement and Technologies/Strategies.

Intent: A statement of the primary goal for the credit;
Requirement: Quantifiable conditions necessary to achieve stated intent;
Technologies/Strategies: Suggested technologies, strategies and referenced guidance on the means to achieve identified requirements.

4) Projects are evaluated for each SPiRiT credit which are either 'Prerequisites' or result in a point score:

Prerequisites: These credits are a statement of minimum requirements and must be met. No further points will be awarded unless the minimum is achieved. These credits are recognizable by an 'R' in the number scheme, ex. 1.R1, and a 'Reqd.' in the score column.
Point Score: These credits are evaluated and result in a point score. Where the potential score is greater than 1, no partial points are granted.

5) SPiRiT Sustainable Project Certification Levels:

| | |
|---|---|
| SPiRiT Bronze | 25 to 34 Points |
| SPiRiT Silver | 35 to 49 Points |
| SPiRiT Gold | 50 to 74 Points |
| SPiRiT Platinum | 75 to 100 Points |

6) SPiRiT credits have been developed to address facility life cycle phases including programming, design, construction, and commissioning. Additional rating tools will be developed to address installation/base master planning and facilities operations and maintenance, rehabilitation, recycling, and disposal.

7) POC for U. S. Army Corps of Engineers:

Mr. Harry Goradia
U. S. Army Corps of Engineers
ATTN: CEMP-ET
441 G Street NW
Washington, DC 20314
Phone (202) 761-7170, FAX (202) 761-0633
Email harry.goradia@hq02.usace.army.mil

POC for U. S. Army Installations:

Mr. John Scharl
U. S. Army Assistant Chief of Staff for Installation Management, Directorate of Facilities & Housing
ATTN: DAIM-FDF
7701 Telegraph Road, Bldg #2594 (Room 146B),
Alexandria, VA 22315-3800
Phone (703) 428-7614, FAX (703) 428-0197
Email scharla@hqda.army.mil

8) Sustainable Project Rating Tool (SPiRiT) Authors are:
Stephen N. Flanders (Lead), U. S. Army Engineering Research & Development Center (ERDC-CRREL)
Richard L. Schneider, U. S. Army Engineering Research & Development Center (ERDC-CERL)
Donald Fournier, U. S. Army Engineering Research & Development Center (ERDC-CERL)
Annette Stumpf, U. S. Army Engineering Research & Development Center (ERDC-CERL)

9) Army/USACE employees are members of the USGBC with membership privileges accessible via the USGBC web site, http://www.usgbc.org. For information on membership and access to available LEED resources to support use of SPiRiT and sustainable design in your projects, contact Richard Schneider at (217) 373-6752 or richard.l.schneider@erdc.usace.army.mil (Annette Stumpf at (217) 352-6511 ext. 7542 or annette.l.stumpf@erdc.usace.army.mil alternate).

10) For the latest information on SPiRiT and for access to guidance, tools and resources supporting sustainable design initiatives, visit the CERL 'Sustainable Design and Development Resource' website, http://www.cecer.army.mil/SustDesign. There you may also join the CERL Sustainable Design ListServ to be directly notified of information pertinent to sustainable design.

# 1.0 Sustainable Sites — Score 20

## 1.R1 Erosion, Sedimentation, and Water Quality Control [1] — Reqd.

Intent: Control erosion and pollutants to reduce negative impacts on water and air quality.

Requirement:

- ❑ Design a site sediment and erosion control plan and a pollution prevention plan that conforms to best management practices in the EPA's Storm Water Management for Construction Activities, EPA Document No. EPA-833-R-92-001, Chapter 3, OR local Erosion and Sedimentation Control standards and codes, whichever is more stringent. The plan shall meet the following objectives:
  - Prevent loss of soil during construction by storm water runoff and/or wind erosion, including protecting topsoil by stockpiling for reuse.
  - Prevent sedimentation of storm sewer or receiving streams and/or air pollution with dust and particulate matter.
  - Prevent hazardous material discharge into storm water systems.
  - Prevent petroleum oils and lubricants (POL) discharge into storm water systems.

Technologies /Strategies: The EPA standard lists numerous measures such as silt fencing, sediment traps, oil grit separators, construction phasing, stabilization of steep slopes, maintaining vegetated ground cover and providing ground cover that will meet this prerequisite.

## 1.C1 Site Selection [1]

Intent: Avoid development of inappropriate sites and reduce the environmental impact from the location of a building on a site. Select site based on functional adjacencies/relationships and land use compatibility.

Requirement:

- ❑ Do not develop buildings on portions of sites that meet any one of the following criteria: 1
  - Prime training or maneuver land.
  - Land whose elevation is lower than 5 ft. above the 100-year flood elevation as defined by FEMA.
  - Land that provides habitat for any species on the Federal or State threatened or endangered list.
  - Within 100 feet of any wetland as defined by 40 CFR, Parts 230-233 and Part 22, OR as defined by local or state rule or law, whichever is more stringent.
- ❑ Select site based on functional adjacencies/relationships and land use compatibility. 1
  - Select sites close to existing roads and utilities or use an existing structure to minimize the need for new infrastructure.
  - Select site in area of high density.
  - Site facilities based on the strength of their relationships to other facilities/land-uses to limit travel distances. The stronger the relationship/functional interaction, the closer the distance between two facilities.
  - Select for distance to installation/base transit systems and access to pedestrian ways and bike paths.
  - Select for development previously used or developed suitable and available sites.

Technologies /Strategies: Screen potential building sites for these criteria and/or ensure that these criteria are addressed by the designer during the conceptual design phase. Utilize landscape architects, ecologists, environmental engineers, civil engineers, and similar professionals for the screening process. New wetlands constructed as part of stormwater mitigation or other site restoration efforts are not affected by the restrictions of this prerequisite.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**1.C2** **Installation/Base Redevelopment** [1]

Intent: Channel development to installation/base cantonment areas with existing infrastructure, protecting greenfields and preserving habitat and natural resources.

Requirement:

- ❑ Increase localized density to conform to existing or desired density goals by utilizing sites that are located within existing cantonment areas of high development density. **1**
- ❑ Select sites close to existing roads and utilities or use an existing structure to minimize the need for new infrastructure. **1**

Technologies /Strategies: During the site selection process give preference to previously developed sites with installation/base cantonment redevelopment potential such as facility reduction program cleared sites.

**1.C3** **Brownfield Redevelopment** [1]

Intent: Rehabilitate damaged sites where development is complicated by real or perceived environmental contamination, reducing pressure on undeveloped land.

Requirement:

- ❑ Develop on a site classified as a brownfield and provide remediation as required by EPA's Brownfield Redevelopment program requirements OR Develop a brownfield site (a site that has been contaminated by previous uses). **1**

Technologies /Strategies: Screen potential damaged sites for these criteria prior to selection for rehabilitation.

Utilize EPA OSWER Directive 9610.17 and ASTM Standard Practice E1739 for site remediation where required.

**1.C4** **Alternative Transportation** [1]

Intent: Reduce pollution and land development impacts from automobile use.

Requirement:

- ❑ Locate building within ½ mile of installation/base transit systems. **1**
- ❑ Provide suitable means for securing bicycles, with convenient changing/shower facilities for use by cyclists, for 5% or more of building occupants. **1**
- ❑ Locate building within 2 miles of alternative-fuel refueling station(s). **1**
- ❑ Size parking capacity not to exceed minimum installation/base cantonment requirements AND provide preferred parking for carpools or van pools capable of serving 5% of the building occupants, OR, add no new parking for rehabilitation projects AND provide preferred parking for carpools or van pools capable of serving 5% of the building occupants. **1**

Technologies /Strategies: Select sites near public installation/base transit served by safe, convenient pedestrian pathways.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**1.C5** **Reduced Site Disturbance** [1]

Intent: Conserve existing natural areas and restore damaged areas to provide habitat and promote biodiversity.

Requirement:

- ☐ On greenfield sites, limit site disturbance including earthwork and clearing of vegetation to 40 feet beyond the building perimeter, 5 feet beyond primary roadway curbs, walkways, and main utility branch trenches, and 25 feet beyond pervious paving areas that require additional staging areas in order to limit compaction in the paved area; OR, on previously developed sites, restore a minimum of 50% of the remaining open area by planting native or adapted vegetation. **1**
- ☐ Reduce the development footprint (including building, access roads and parking) to exceed the installation/base's/base's master plan local zoning's open space requirement for the site by 25% or in accordance with installation/base policy on open space set asides, whichever is greater. **1**

Technologies /Strategies: Note requirements on plans and in specifications. Establish contractual penalties for destruction of trees and site areas noted for protection. Reduce footprints by tightening program needs and stacking floor plans. Establish clearly marked construction and disturbance boundaries. Delineate laydown, recycling, and disposal areas. Use areas to be paved as staging areas. Work with local horticultural extension services, native plant societies, or installation/base agronomy staff to select indigenous plant species for site restoration and landscaping.

**1.C6** **Stormwater Management** [1]

Intent: Limit disruption of natural water flows by minimizing storm water runoff, increasing on-site infiltration and reducing contaminants.

Requirement: Implement a stormwater management plan that results in:

- ☐ No net increase in the rate or quantity of stormwater runoff from undeveloped to developed conditions; OR, if existing imperviousness is greater than 50%, implement a stormwater management plan that results in a 25% decrease in the rate and quantity of stormwater runoff. **1**
- ☐ Treatment systems designed to remove 80% of the average annual post development total suspended solids (TSS), and 40% of the average annual post development total phosphorous (TP), by implementing Best Management Practices (BMPs) outlined in EPA's Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters (EPA-840-B-92-002 1/93). **1**

Technologies /Strategies: Significantly reduce impervious surfaces, maximize on-site stormwater infiltration, and retain pervious and vegetated areas. Capture rainwater from impervious areas of the building for groundwater recharge or reuse within building. Use green/vegetated roofs. Utilize biologically-based and innovative stormwater management features for pollutant load reduction such as constructed wetlands, stormwater filtering systems, bioswales, bio-retention basins, and vegetated filter strips. Use open vegetated swales to reduce drainage velocity and erosion, reduce system maintenance, increase vegetative variety and support wildlife habitat where space permits.

**1.C7** **Landscape and Exterior Design to Reduce Heat Islands** [2]

Intent: Reduce heat islands (thermal gradient differences between developed and undeveloped areas) to minimize impact on microclimate and human and wildlife habitat.

Requirement:

- ☐ Provide shade (within 5 years) on at least 30% of non-roof impervious surface on the site, including parking lots, walkways, plazas, etc., OR, use light-colored/ high-albedo materials (reflectance of at least 0.3) for 30% of the site's non-roof impervious surfaces, OR place a minimum of 50% of parking space under-ground OR use open-grid pavement system (net impervious area of LESS than 50%) for a minimum of 50% of the parking lot area. **1**
- ☐ Use ENERGY STAR Roof compliant, high-reflectance AND low emissivity roofing (initial reflectance of at least .65 and three-year-aged reflectance of at least .5 when tested in accordance with ASTM E408) for a minimum of 75% of the roof surface; OR, install a "green" (vegetated) roof for at least 50% of the roof area. **1**

Technologies /Strategies: Employ design strategies, materials, and landscaping designs that reduce heat absorption of exterior materials. Note albedo/reflectance requirements in the drawings and specifications. Provide shade (calculated on June 21, noon solar time) using native or climate tolerant trees and large shrubs, vegetated trellises, or other exterior structures supporting vegetation. Substitute vegetated surfaces for hard surfaces. Explore elimination of blacktop and the use of new coatings and integral colorants for asphalt to achieve light colored surfaces.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

[2] © U. S. Green Building Council. Used by permission.

**1.C8** **Light Pollution Reduction** [1]

Intent: Eliminate light trespass from the building site, improve night sky access, and reduce development impact on nocturnal environments.

Requirement: ❑ Do not exceed Illuminating Engineering Society of North America (IESNA) footcandle level requirements as stated in the Recommended Practice Manual: Lighting for Exterior Environments, AND design interior and exterior lighting such that zero direct-beam illumination leaves the building site. 1

Technologies /Strategies: Consult IESNA Recommended Practice Manual: Lighting for Exterior Environments for Commission Internationle de l'Eclairage (CIE) zone and pre and post curfew hour descriptions and associated ambient lighting level requirements. Ambient lighting for pre-curfew hours for CIE zones range between .01 footcandles for areas with dark landscapes such as parks, rural, and residential areas, and 1.5 footcandles for areas with high ambient brightness such as installation/base areas with high levels of nighttime activity. Design site lighting and select lighting styles and technologies to have a minimal impact off-site and minimal contribution to sky glow. Minimize lighting of architectural and landscape features. Exterior lighting should be consistent with security lighting requirements.

**1.C9** **Optimize Site Features**

Intent: Optimize utilization of the site's existing natural features and placement of man-made features on the site.

Requirement: ❑ Perform both of the following: 1

- Maximize the use of free site energy.
- Plan facility, parking and roadways to "fit" existing site contours and limit cut and fill.

Technologies /Strategies: Evaluate site resources to ascertain how each can enhance the proposed project and visa versa. Work to maximum advantage of the site's solar and wind attributes. Use landscaping to optimize solar and wind conditions and to contribute to energy efficiency; Locate and orient the facility on the site to optimize solar and wind conditions.

**1.C10** **Facility Impact**

Intent: Minimize negative impacts on the site and on neighboring properties and structures; avoid or mitigate excessive noise, shading on green spaces, additional traffic, obscuring significant views, etc.

Requirement: ❑ Cluster facilities to reduce impact, access distance to utilities and sufficient occupant density to support mass transit. 1

❑ Collaborate with installation/base and community planners to identify and mitigate potential impacts of the project beyond site boundaries, and transportation planners to insure efficient public transport. 1

Technologies /Strategies: Involve local/regional planners and community members in installation/base master planning processes. Recognize the context and the impact of a project beyond site boundaries, and integrate it with the larger installation/base/community context/land use.

**1.C11** **Site Ecology**

Intent: Identify and mitigate all existing site problems including contamination of soil, water, and air, as well as any negative impacts caused by noise, eyesores, or lack of vegetation, enhancing or creating new site habitat.

Requirement: ❑ Develop site environmental management and mitigation plan. 1

Technologies /Strategies: Understand site and surrounding ecosystem interdependence and interconnectivity. Plan landscaping scheme to incorporate biodiversity. Preserve/enhance existing trees, hydrological features, ecosystems, habitats, and cultural resources. Increase the existence of healthy habitat for native species. Reintroduce native plants and trees where they have been destroyed by previous development.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

## 2.0 Water Efficiency — Score 5

### 2.C1 Water Efficient Landscaping [2]

Intent: Limit or eliminate the use of potable water for landscape irrigation.

Requirement:

- ❑ Use high efficiency irrigation technology, OR, use captured rain or recycled site water to reduce potable water consumption for irrigation by 50% over conventional means. **1**
- ❑ Use only captured rain or recycled site water for an additional 50% reduction (100% total reduction) of potable water for site irrigation needs, OR, do not install permanent landscape irrigation systems. **1**

Technologies /Strategies: Develop a landscaping water use baseline according to the methodology outlined in the LEED Reference Guide. Specify water-efficient, native or adapted, climate tolerant plantings. High efficiency irrigation technologies include micro irrigation, moisture sensors, or weather data based controllers. Feed irrigation systems with captured rainwater, gray water, or on-site treated wastewater.

### 2.C2 Innovative Wastewater Technologies [2]

Intent: Reduce generation of wastewater and potable water demand, while increasing local aquifer recharge.

Requirement:

- ❑ Reduce the use of municipally provided potable water for building sewage conveyance by a minimum of 50%, OR, treat 100% of wastewater on site to tertiary standards. **1**

Technologies /Strategies: Develop a wastewater baseline according to the methodology outlined in the LEED Reference Guide. Implement decentralized on-site wastewater treatment and reuse systems. Decrease the use of potable water for sewage conveyance by utilizing gray and/or black water systems. Non-potable reuse opportunities include, toilet flushing, landscape irrigation, etc. Provide advanced wastewater treatment after use by employing innovative, ecological, on-site technologies including constructed wetlands, a mechanical recirculating sand filter, or aerobic treatment systems.

### 2.C3 Water Use Reduction [1]

Intent: Maximize water efficiency within buildings to reduce the burden on municipal water supply and wastewater systems.

Requirement:

- ❑ Employ strategies that in aggregate use 20% less water than the water use baseline calculated for the building (not including irrigation) after meeting Energy Policy Act (EPACT) of 1992 fixture performance requirements. **1**
- ❑ Exceed the potable water use reduction by an additional 10% (30% total efficiency increase). **1**

Technologies /Strategies: Develop a water use baseline including all water consuming fixtures, equipment, and seasonal conditions according to methodology guidance outlined in the LEED Reference Guide. Specify water conserving plumbing fixtures that exceed Energy Policy Act (EPACT) of 1992 fixture requirements in combination with ultra high efficiency or dry fixture and control technologies. Specify high water efficiency equipment (dishwashers, laundry, cooling towers, etc.). Use alternatives to potable water for sewage transport water. Use recycled or storm water for HVAC/process make up water. Install cooling tower systems designed to minimize water consumption from drift, evaporation and blowdown.

---

## 3.0 Energy and Atmosphere — Score 28

### 3.R1 Fundamental Building Systems Commissioning [1] — Reqd.

Intent: Verify and ensure that fundamental building elements and systems are designed, installed and calibrated to operate as intended.

Requirement: ❑ Implement all of the following fundamental best practice commissioning procedures.

- Engage a commissioning authority.
- Develop design intent and basis of design documentation.
- Include commissioning requirements in the construction documents.
- Develop and utilize a commissioning plan.
- Verify installation, functional performance, training and documentation.
- Complete a commissioning report.

Technologies /Strategies: Introduce standards and strategies into the design process early, and then carry through selected measures by clearly stating target requirements in the construction documents. Tie contractor final payments to documented system performance. Perform additional commissioning in accordance with the DOE Building Commissioning Guide, Version 2.2. Refer to the LEED Reference Guide for detailed descriptions of required elements and references to additional commissioning guides. Specify pre-occupancy baseline IAQ testing at time of commissioning. Test for indoor air concentrations of CO, CO2, total VOCs and particulates. Test to assure that adequate ventilation rates have been achieved prior to initial occupancy.

### 3.R2 Minimum Energy Performance [1] — Reqd.

Intent: Establish the minimum level of energy efficiency for the base building and systems.

Requirement: ❑ Design to meet building energy efficiency and performance as required by TI 800-01 (Design Criteria).

Technologies /Strategies: Use building modeling and analysis techniques to establish and document compliance. ASHRAE/IESNA 90.1-1999 provides guidance for establishing building base case development and analysis. Refer to the LEED Reference Guide for a wide variety of energy efficiency strategy resources.

Use a professionally recognized and proven computer program or programs that integrate architectural features with air-conditioning, heating, lighting, and other energy producing or consuming systems. These programs will be capable of simulating the features, systems, and thermal loads used in the design. Using established weather data files, the program will perform 8760 hourly calculations. BLAST, DOE-2 or EnergyPlus are acceptable programs for these purposes.

### 3.R3 CFC Reduction in HVAC&R Equipment [2] — Reqd.

Intent: Reduce ozone depletion.

Requirement: ❑ Zero use of CFC-based refrigerants in new base building HVAC&R systems. When reusing existing base building HVAC equipment, complete a comprehensive CFC phaseout conversion.

Technologies /Strategies: Specify only non-CFC-based refrigerants in all base building HVAC&R systems.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

[2] © U. S. Green Building Council. Used by permission.

**3.C1** **Optimize Energy Performance** [1]

Intent: Achieve increasing levels of energy performance above the prerequisite standard to reduce environmental impacts associated with excessive energy use.

Requirement:

- ❑ Reduce design energy usage (DEU) compared to the energy use budget (EUB) in joules per square meter per year for regulated energy components as described in the requirements of Chapter 11 of the TI 800-01 (Design Criteria), as demonstrated by a whole building simulation. **20**
  - 1 Point will be awarded for every reduction in design energy use of 2.5% for both new and existing facilities for a maximum score of 20 points.

Regulated energy components include HVAC systems, building envelope, service hot water systems, lighting and other regulated systems as defined by ASHRAE.

Technologies /Strategies: Develop and use building modeling and analysis techniques to establish a base case that meets the minimum prerequisite standard. ASHRAE/IESNA 90.1-1999 provides guidance for establishing building base case development and analysis. Perform interactive energy use analysis for selected design elements that affect energy performance and document compliance.

Unit of measure for performance shall be annual energy usage in joules per square meter. Life-Cycle energy costs shall be determined using rates for purchased energy, such as electricity, gas, oil, propane, steam, and chilled water and approved by the adopting authority. Refer to the LEED Reference Guide or Whole Building Design Guide for a wide variety of energy efficiency resources and strategies including conservation measures, electromechanical energy efficiency technologies (for example ground-source heat pumps), passive heating and cooling strategies, solar hot water, and daylighting.

Life-Cycle costing will be done in accordance with 10 CFR 436.

Consider installation of an Energy Management and Control System (EMCS), which is compatible with exiting installation systems to optimize performance. Use sensors to control loads based on occupancy, schedule and/or the availability of natural resources use (day light or natural ventilation).

**3.C2** **Renewable Energy** [1]

Intent: Encourage and recognize increasing levels of self-supply through renewable technologies to reduce environmental impacts associated with fossil fuel energy use.

Requirement:

- ❑ Supply a net fraction of the building's total energy use through the use of on-site renewable energy systems.

| % of Total Annual Energy Usage in Renewables | |
|---|---|
| 5% | 1 |
| 10% | 2 |
| 15% | 3 |
| 20% | 4 |

Technologies /Strategies: Employ the use of on-site non-polluting-source renewable technologies contributing to the total energy requirements of the project. Consider and use high temperature solar and/or geothermal, photovoltaics, wind, biomass (other than unsustainably harvested wood), and bio-gas. Passive solar, solar hot water heating, ground-source heat pumps, and daylighting do not qualify for points under this credit. Credit for these strategies is given in Energy & Atmosphere Credit 1: Optimizing Energy Performance.

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**3.C3** **Additional Commissioning** [2]

Intent: Verify and ensure that the entire building is designed, constructed, and calibrated to operate as intended.

Requirement: ❑ In addition to the Fundamental Building Commissioning prerequisite, implement the following additional commissioning tasks: **1**

1. Conduct a focused review of the design prior to the construction documents phase.
2. Conduct a focused review of the construction documents when close to completion.
3. Conduct a selective review of contractor submittals of commissioned equipment.
4. Develop a system and energy management manual.
5. Have a contract in place for a near-warranty end or post occupancy review.

Items 1, 2, and 3 must be performed by someone other than the designer.

Technologies /Strategies: Introduce standards and strategies into the design process early, and then carry through selected measures by clearly stating target requirements in the construction documents. Tie contractor final payments to documented system performance. Refer to the LEED Reference Guide for detailed descriptions of required elements and references to additional guidelines.

**3.C4** **<< Deleted >>** [1]

**3.C5** **Measurement and Verification** [1]

Intent: Provide for the ongoing accountability and optimization of building energy and water consumption performance over time.

Requirement: ❑ Comply with the installed equipment requirements for continuous metering as stated in selected Measurement and Verification Methods - Option B: Retrofit Isolation of the US DOE's International Performance Measurement and Verification Protocol (IPMVP) for the following: **1**

- Lighting systems and controls.
- Constant and variable motor loads.
- Variable frequency drive (VFD) operation.
- Chiller efficiency at variable loads (kW/ton).
- Cooling load.
- Air and water economizer and heat recovery cycles.
- Air distribution static pressures and ventilation air volumes.
- Boiler efficiencies.
- Building specific process energy efficiency systems and equipment.
- Indoor water risers and outdoor irrigation systems.

Technologies /Strategies: Design and specify equipment to be installed in base building systems to allow for comparison, management, and optimization of actual vs. estimated energy and water performance. Employ building automation systems to perform M&V functions where applicable. Tie contractor final payments to documented M&V system performance and include in the commissioning report. Provide for ongoing M&V system maintenance and operating plan in building operations and maintenance manuals. Consider installation/base of an Energy Management and Control System (EMCS), which is compatible with exiting installation/base systems to optimize performance.

---

[2] © U. S. Green Building Council. Used by permission.

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**3.C6** **Green Power** [1]

Intent: Encourage the development and use of grid-source, renewable energy technologies on a net zero pollution basis.

Requirement: ❑ Engage in a two year contract to purchase the amount of power equal to projected building consumption generated from renewable sources that meet the Center for Resource Solutions (CRS) Green-E requirements. 1

Technologies /Strategies: Purchase power from a provider that guarantees a fraction of its delivered electric power is from net nonpolluting renewable technologies. Begin by contacting local utility companies. If the project is in an open market state, investigate Green Power and Power Marketers licensed to provide power in that state. Grid power that qualifies for this credit originates from solar, wind, geothermal, biomass, or low-impact hydro sources. Low-impact hydro shall comply with the Low Impact Hydropower Certification Program.

**3.C7** **Distributed Generation**

Intent: Encourage the development and use of distributed generation technologies, which are less polluting than grid-source energy.

Requirement: ❑ Reduce total energy usage and emissions by considering source energy implications and local cogeneration and direct energy conversion. Generate at least 50% of the building's projected annual consumption by on-site distributed generation sources. 1

Technologies /Strategies: Investigate the use of integrated generation and delivery systems, such as co-generation, fuel cells, micro-turbines and off-peak thermal storage.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**4.R1** **Storage & Collection of Recyclables** [1] **Reqd.**

Intent: Facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills.

Requirement:

- ❑ Provide an easily accessible area that serves the entire building that is dedicated to the separation, collection and storage of materials for recycling including (at a minimum) paper, glass, plastics, and metals.

Technologies /Strategies: Establish a waste management plan which meets requirements of the installation/base environmental and/or solid waste management plans in cooperation with users to encourage recycling. Reserve space for recycling functions early in the building occupancy programming process and show areas dedicated to collection of recycled materials on space utilization plans. Broader recycling support space considerations should allow for collection and storage of the required elements and newspaper, organic waste (food and soiled paper), and dry waste. When collection bins are used, bin(s) should be able to accommodate a 75% diversion rate and be easily accessible to custodial staff and recycling collection workers. Consider bin designs that allow for easy cleaning to avoid health issues.

**4.C1** **Building Reuse** [1]

Intent: Extend the life cycle of existing building stock, conserve resources, retain cultural resources, reduce waste, and reduce environmental impacts of new buildings as they relate to materials manufacturing and transport.

Requirement: Reuse large portions of existing structures during renovation or redevelopment projects.

- ❑ Maintain at least 75% of existing building structure and shell (exterior skin and framing excluding window assemblies). **1**
- ❑ Maintain an additional 25% (100% total) of existing building structure and shell (exterior skin and framing excluding window assemblies). **1**
- ❑ Maintain 100% of existing building structure and shell AND 50% non-shell (walls, floor coverings, and ceiling systems). **1**

Technologies /Strategies: Evaluate retention of existing structure. Consider facade preservation, particularly in installation/base areas. During programming and space planning, consider adjusting needs and occupant use patterns to fit within existing building structure and interior partition configurations. Identify and effectively address energy, structural, and indoor environmental (lead & asbestos) issues in building reuse planning and deconstruction documents. Percentage of reused non-shell building portions will be calculated as the total area (s.f.) of reused walls, floor covering, and ceiling systems, divided by the existing total area (s.f.) of walls, floor covering, and ceiling systems.

**4.C2** **Construction Waste Management** [1]

Intent: Divert construction, demolition, and land clearing debris from landfill disposal. Redirect recyclable material back to the manufacturing process.

Requirement: Develop and implement a waste management plan, quantifying material diversion by weight:

- ❑ Recycle and/or salvage at least 50% (by weight) of construction, demolition, and land clearing waste. **1**
- ❑ Recycle and/or salvage an additional 25% (75% total by weight) of the construction, demolition, and land clearing debris. **1**

Technologies /Strategies: Develop and specify a waste management plan which meets requirements of the installation/base environmental and/or solid waste management plans that identifies licensed haulers and processors of recyclables; identifies markets for salvaged materials; employs deconstruction, salvage, and recycling strategies and processes, includes waste auditing; and documents the cost for recycling, salvaging, and reusing materials. Source reduction on the job site should be an integral part of the plan.

The plan should address recycling of corrugated cardboard, metals, concrete brick, asphalt, land clearing debris (if applicable), beverage containers, clean dimensional wood, plastic, glass, gypsum board, and carpet; evaluate the cost-effectiveness of recycling rigid insulation, engineered wood products and other materials; hazardous materials storage and management; and participation in manufacturers' "take-back" programs to the maximum extent possible. Refer to the LEED Reference Guide for guidelines and references that provide waste management plan development and implementation support including model bid specifications.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**4.C3** **Resource Reuse** [2]

Intent: Extend the life cycle of targeted building materials, reducing environmental impacts related to materials manufacturing and transport.

Requirement:

- ❑ Specify salvaged or refurbished materials for 5% of building materials. 1
- ❑ Specify salvaged or refurbished materials for 10% of building materials. 1

Technologies /Strategies: Commonly salvaged building materials include wood flooring/ paneling/cabinets, doors and frames, mantels, iron work and decorative lighting fixtures, brick, masonry and heavy timbers. See the LEED Reference Guide for calculation tools and guidelines. Determine percentages in terms of dollar value using the following steps:

1. Calculate total dollars* (see exclusions) of the salvaged or refurbished material.
2. Calculate total dollars (see exclusions) of all building materials.
3. Divide Step 1 by Step 2 to determine the percentage.

Exclusions: In total dollar calculations, exclude; labor costs; all mechanical and electrical material and labor costs; and project overhead and fees. *If the cost of the salvaged or refurbished material is below market value, use replacement cost to estimate the material value, otherwise use actual cost to the project.

**4.C4** **Recycled Content** [1]

Intent: Increase demand for building products that have incorporated recycled content material, reducing the impacts resulting from extraction of new material.

Requirement:

- ❑ Specify a minimum of 25% of building materials that contain in aggregate a minimum weighted average of 20% post-consumer recycled content material, OR, a minimum weighted average of 40% post-industrial recycled content material. 1
- ❑ Specify an additional 25% (50% total) of building materials that contain in aggregate, a minimum weighted average of 20% post consumer recycled content material, OR, a minimum weighted average of 40% post-industrial recycled content material. 1

Technologies /Strategies: Specify building materials containing recycled content for a fraction of total building materials. Select products and materials with supporting information from the AIA Resource Guide or the EPA Environmentally Preferable Purchasing (EPP) Program. Common building materials and products with recycled content include; wall, partition, and ceiling materials and systems; insulation; tiles and carpets; cement, concrete, and reinforcing metals; structural and framing steel. For products/materials not listed, selection should be made on the basis of EPP criterion and/or:

- Toxicity;
- Embodied energy;
- Production use of water, energy and ozone depleting substances (ODSs);
- Production limits on toxic emissions and effluents;
- Minimal, reusable or recycled/recyclable packaging;
- Impact on indoor environmental quality (IEQ);
- Installation that limits generation of waste;
- Materials that limit waste generation over their life;
- EPA guideline compliance; and
- Harvested on a sustainable yield basis.

See the LEED Reference Guide for a summary of the EPA guidelines and calculation methodology guidelines. Determine percentages in terms of dollar value using the following steps:

1. Calculate total dollars (see exclusions) of the material that contain recycled content.
2. Calculate total dollars (see exclusions) of all building materials.
3. Divide Step 1 by Step 2 to determine the percentage.

Exclusions: Labor costs; all mechanical and electrical material and labor costs; project overhead and fees)

---

[2] © U. S. Green Building Council. Used by permission.

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**4.C5** **Local/Regional Materials** [2]

Intent: Increase demand for building products that are manufactured locally, reducing the environmental impacts resulting from transportation, and supporting the local economy.

Requirement:

- ❑ Specify a minimum of 20% of building materials that are manufactured regionally within a radius of 500 miles. 1
- ❑ Of these regionally manufactured materials, specify a minimum of 50% that are extracted, harvested, or recovered within 500 miles. 1

Technologies /Strategies: Specify and install regionally extracted, harvested, and manufactured building materials. Contact the state and local waste management boards for information about regional building materials. See the LEED Reference Guide for calculation methodology guidelines. Determine percentages in terms of dollar value using the following steps:

1. Calculate total dollars (see exclusions) of material that is locally or regionally manufactured.
2. Calculate total dollars (see exclusions) of all building materials.
3. Divide Step 1 by Step 2 to determine the percentage.

Exclusions: Labor costs; all mechanical and electrical material and labor costs; project overhead and fees.

**4.C6** **Rapidly Renewable Materials** [2]

Intent: Reduce the use and depletion of finite raw and long cycle renewable materials by replacing them with rapidly renewable materials.

Requirement:

- ❑ Specify rapidly renewable building materials for 5% of total building materials. 1

Technologies /Strategies: Rapidly renewable resources are those materials that substantially replenish them-selves faster than traditional extraction demand (e.g. planted and harvested in less than a 10 year cycle) and do not result in significant biodiversity loss, increase erosion, air quality impacts, and that are sustainably managed. See the LEED Reference Guide for calculation methodology guidelines. Determine percentages in terms of dollar value using the following steps:

1. Calculate total dollars (see exclusions) of materials that are considered to be rapidly renewable.
2. Calculate total dollars (see exclusions) of all building materials.
3. Divide Step 1 by Step 2 to determine the percentage.

Exclusions: Labor costs; all mechanical and electrical material and labor costs; project overhead and fees.

**4.C7** **Certified Wood** [2]

Intent: Encourage environmentally responsible forest management.

Requirement:

- ❑ Use a minimum of 50% of wood-based materials certified in accordance with the Forest Stewardship Council guidelines for wood building components including but not limited to framing, flooring, finishes, furnishings, and non-rented temporary construction applications such as bracing, concrete form work and pedestrian barriers. 1

Technologies /Strategies: Refer to the Forest Stewardship Council guidelines for wood building components that qualify for compliance to the requirements and incorporate into material selection for the project.

---

[2] © U. S. Green Building Council. Used by permission.

## 5.0 Indoor Environmental Quality (IEQ) Score 17

**5.R1** **Minimum IAQ Performance** [1] **Reqd.**

Intent: Establish minimum IAQ performance to prevent the development of indoor air quality problems in buildings, maintaining the health and well being of the occupants.

Requirement: ❑ Meet the minimum requirements of voluntary consensus standard ASHRAE 62-1999, Ventilation for Acceptable Indoor Air Quality and approved Addenda.

Technologies /Strategies: Include proactive design details that will eliminate some of the common causes of indoor air quality problems in buildings. Introduce standards into the design process early. Incorporate references to targets in plans and specifications. Ensure ventilation system outdoor air capacity can meet standards in all modes of operation. Locate building outdoor air intakes (including operable windows) away from potential pollutants/contaminant sources such as sporulating plants (allergens), loading areas, building exhaust fans, cooling towers, sanitary vents, dumpsters, vehicular exhaust, and other sources. Include operational testing in the building commissioning report. Design cooling coil drain pans to ensure complete draining. Include measures to control and mitigate radon buildup in areas where it is prevalent. Limit humidity to a range that minimizes mold growth and promotes respiratory health.

**5.R2** **Environmental Tobacco Smoke (ETS) Control** [2] **Reqd.**

Intent: Prevent exposure of building occupants and systems to Environmental Tobacco Smoke (ETS).

Requirement: ❑ Zero exposure of nonsmokers to ETS by prohibition of smoking in the building, OR, by providing a designated smoking room designed to effectively contain, capture and remove ETS from the building. At a minimum, the smoking room shall be directly exhausted to the outdoors with no recirculation of ETS-containing air to the non-smoking area of the building, enclosed with impermeable structural deck-to-deck partitions and operated at a negative pressure compared with the surrounding spaces of at least 7 Pa (0.03 inches of water gauge). Performance of smoking rooms shall be verified using tracer gas testing methods as described in ASHRAE Standard 129-1997. Acceptable exposure in non-smoking areas is defined as less than 1% of the tracer gas concentration in the smoking room detectable in the adjoining non-smoking areas. Smoking room testing as described in the ASHRAE Standard 129-1997 is required in the contract documents and critical smoking facility systems testing results must be included in the building commissioning plan and report or as a separate document.

Technologies /Strategies: Prohibit smoking in the building and/or provide designated smoking areas outside the building in locations where ETS cannot reenter the building or ventilation system and away from high building occupant or pedestrian traffic.

**5.C1** **IAQ Monitoring** [1]

Intent: Provide capacity for indoor air quality (IAQ) monitoring to sustain long term occupant health and comfort.

Requirement: ❑ Install a permanent carbon dioxide ($CO_2$) monitoring system that provides feedback on space ventilation performance in a form that affords operational adjustments, AND specify initial operational set point parameters that maintain indoor carbon dioxide levels no higher than outdoor levels by more than 530 parts per million at any time. 1

Technologies /Strategies: Install an independent system or make $CO_2$ monitoring a function of the building automation system. Situate monitoring locations in areas of the building with high occupant densities and at the ends of the longest runs of the distribution ductwork. Specify that system operation manuals require calibration of all of the sensors per manufacturer recommendations but not less than one year. Include sensor and system operational testing and initial set point adjustment in the commissioning plan and report. Also consider periodic monitoring of carbon monoxide (CO), total volatile organic compounds (TVOCs), and particulates (including PM10).

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

**5.C2** **Increase Ventilation Effectiveness** [2]

Intent: Provide for the effective delivery and mixing of fresh air to building occupants to support their health, safety, and comfort.

Requirement:

- ❑ For mechanically ventilated buildings, design ventilation systems that result in an air change effectiveness (E) greater than or equal to 0.9 as determined by ASHRAE 129-1997. For naturally ventilated spaces demonstrate a distribution and laminar flow pattern that involves not less than 90% of the room or zone area in the direction of air flow for at least 95% of hours of occupancy. 1

Technologies /Strategies: Employ architectural and HVAC design strategies to increase ventilation effectiveness and prevent short-circuiting of airflow delivery. Techniques available include use of displacement ventilation, low velocity, and laminar flow ventilation (under floor or near floor delivery) and natural ventilation. Operable windows with an architectural strategy for natural ventilation, cross ventilation, or stack effect can be appropriate options with study of inlet areas and locations. See the LEED Reference Guide for compliance methodology guidelines.

**5.C3** **Construction IAQ Management Plan** [2]

Intent: Prevent indoor air quality problems resulting from the construction/renovation process, to sustain long term installer and occupant health and comfort.

Requirement: Develop and implement an Indoor Air Quality (IAQ) Management Plan for the construction and pre-occupancy phases of the building as follows:

- ❑ During construction meet or exceed the minimum requirements of the Sheet Metal and Air Conditioning National Contractors Association (SMACNA) IAQ Guideline for Occupied Buildings under Construction, 1995, AND protect stored on-site or installed absorptive materials from moisture damage, AND replace all filtration media immediately prior to occupancy (Filtration media shall have a Minimum Efficiency Reporting Value (MERV) of 13 as determined by ASHRAE 52.2-1999). 1
- ❑ Conduct a minimum two-week building flushout with new filtration media at 100% outside air after construction ends and prior to occupancy, OR, conduct a baseline indoor air quality testing procedure consistent with current EPA protocol for Environmental Requirements, Baseline IAQ and Materials, for the Research Triangle Park Campus, Section 01445. 1

Technologies /Strategies: Specify containment control strategies including protecting the HVAC system, controlling pollutant sources, interrupting pathways for contamination, enforcing proper housekeeping and coordinating schedules to minimize disruption. Specify the construction sequencing to install absorptive materials after the prescribed dry or cure time of wet finishes to minimize adverse impacts on indoor air quality. Materials directly exposed to moisture through precipitation, plumbing leaks, or condensation from the HVAC system are susceptible to microbial contamination. Absorptive materials to protect and sequence installation include; insulation, carpeting, ceiling tiles, and gypsum products. Appoint an IEQ Manager with owner's authority to inspect IEQ problems and require mitigation as necessary.

**5.C4** **Low-Emitting Materials** [2]

Intent: Reduce the quantity of indoor air contaminants that are odorous or potentially irritating to provide installer and occupant health and comfort.

Requirement: Meet or exceed VOC limits for adhesives, sealants, paints, composite wood products, and carpet systems as follows:

- ❑ Adhesives must meet or exceed the VOC limits of South Coast Air Quality Management District Rule #1168 by, AND all sealants used as a filler must meet or exceed Bay Area Air Resources Board Reg. 8, Rule 51. 1
- ❑ Paints and coatings must meet or exceed the VOC and chemical component limits of Green Seal requirements. 1
- ❑ Carpet systems must meet or exceed the Carpet and Rug Institute Green Label Indoor Air Quality Test Program. 1
- ❑ Composite wood or agrifiber products must contain no added urea-formaldehyde resins. 1

Technologies /Strategies: Evaluate and preferentially specify materials that are low emitting, non-irritating, nontoxic and chemically inert. Request and evaluate emissions test data from manufacturers for comparative products. Ensure that VOC limits are clearly stated in specifications, in General Conditions, or in each section where adhesives, sealants, coatings, carpets, and composite woods are addressed.

---

[2] © U. S. Green Building Council. Used by permission.

**5.C5** **Indoor Chemical and Pollutant Source Control** [1]

Intent: Avoid exposure of building occupants to potentially hazardous chemicals that adversely impact air quality.

Requirement:

- ☐ Design to minimize cross-contamination of regularly occupied areas by chemical pollutants: **1**
  - Employ permanent entryway systems (grills, grates, etc.) to capture dirt, particulates, etc. from entering the building at all high volume entryways, AND provide areas with structural deck to deck partitions with separate outside exhausting, no air recirculation and negative pressure where chemical use occurs (including housekeeping areas and copying/print rooms), AND provide drains plumbed for appropriate disposal of liquid waste in spaces where water and chemical concentrate mixing occurs.

Technologies /Strategies: Design to physically isolate activities associated with chemical contaminants from other locations in the building, providing dedicated systems to contain and remove chemical pollutants from source emitters at source locations. Applicable measures include eliminating or isolating high hazard areas; designing all housekeeping chemical storage and mixing areas (central storage facilities and janitors closets) to allow for secure product storage; designing copy/fax/printer/printing rooms with structural deck to deck partitions and dedicated exhaust ventilation systems; and including permanent architectural entryway system(s) to catch and hold particles to keep them from entering and contaminating the building interior.

Consider utilization of EPA registered anti-microbial treatments in carpet, textile or vinyl wall coverings, ceiling tiles or paints where microbial contamination is a concern. Utilize "breathable" wall finishes where circumstances require, to reduce moisture build-up and prevent microbial contamination. Minimize selection of fibrous materials, e.g. insulation, carpet and padding and flexible fabrics, whose exposed surfaces when exposed to the air stream or occupied space can contribute significant emissions and absorb and re-emit other contaminants over time.

**5.C6** **Controllability of Systems** [2]

Intent: Provide a high level of individual occupant control of thermal, ventilation, and lighting systems to support optimum health, productivity, and comfort conditions.

Requirement:

- ☐ Provide a minimum of one operable window and one lighting control zone per 200 s.f. for all occupied areas within 15 feet of the perimeter wall. **1**
- ☐ Provide controls for each individual for airflow, temperature, and lighting for 50% of the non perimeter, regularly occupied areas. **1**

Technologies /Strategies: Provide individual or integrated controls systems that control lighting, airflow, and temperature in individual rooms and/or work areas. Consider combinations of ambient and task lighting control and operable windows for perimeter and VAV systems for non perimeter with a 1:1: 2 terminal box to controller to occupant ratio.

**5.C7** **Thermal Comfort** [2]

Intent: Provide for a thermally comfortable environment that supports the productive and healthy performance of the building occupants.

Requirement:

- ☐ Comply with ASHRAE Standard 55-1992, Addenda 1995 for thermal comfort standards including humidity control within established ranges per climate zone. **1**
- ☐ Install a permanent temperature and humidity monitoring system configured to provide operators control over thermal comfort performance and effectiveness of humidification and/or dehumidification systems in the building. **1**

Technologies /Strategies: Integrated envelope and HVAC system design strategies that achieve thermal comfort conditions based on mean radiant temperature, local air velocity, relative humidity, and air temperature. Install and maintain a temperature and humidity monitoring system for key areas of the building (i.e., at the perimeter, and spaces provided with humidity control). This function can be satisfied by the building automation system. Specify in system operation manuals that all sensors require quarterly calibration. Include criteria verification and system operation in commissioning plan and report.

---

[1] Adapted material not reviewed or endorsed by U. S. Green Building Council.

[2] © U. S. Green Building Council. Used by permission.

**5.C8** **Daylight and Views** [2]

Intent: Provide a connection between indoor spaces and the outdoor environment through the introduction of sunlight and views into the occupied areas of the building.

Requirement:

- ❑ Achieve a minimum Daylight Factor of 2% (excluding all direct sunlight penetration) in 75% of all space occupied for critical visual tasks, not including copy rooms, storage areas, mechanical, laundry, and other low occupancy support areas. Exceptions include those spaces where tasks would be hindered by the use of daylight or where accomplishing the specific tasks within a space would be enhanced by the direct penetration of sunlight. 1
- ❑ Direct line of sight to vision glazing from 90% of all regularly occupied spaces, not including copy rooms, storage areas, mechanical, laundry, and other low occupancy support areas. 1

Technologies /Strategies: Implement design strategies to provide access to daylight and views to the outdoors in a glare-free way using exterior sun shading, interior light shelves, and /or window treatments. Orient buildings to maximize daylighting options. Consider shallow or narrow building footprints. Employ courtyards, atriums, clerestory windows, skylights, and light shelves to achieve daylight penetration (from other than direct effect or direct rays from the sun) deep into regularly occupied areas of the building.

**5.C9** **Acoustic Environment /Noise Control**

Intent: Provide appropriate acoustic conditions for user privacy and comfort.

Requirement:

- ❑ Minimize environmental noise through appropriate use of insulation, sound-absorbing materials and noise source isolation. 1

Technologies /Strategies: Evaluate each occupied environment and determine the appropriate layout, materials and furnishings design.

**5.C10** **Facility In-Use IAQ Management Plan**

Intent: Insure the effective management of facility air quality during its life.

Requirement:

- ❑ Perform all of the following: 1
  - Develop an air quality action plan to include scheduled HVAC system cleaning.
  - Develop an air quality action plan to include education of occupants and facility managers on indoor pollutants and their roles in preventing them.
  - Develop an air quality action plan to include permanent monitoring of supply and return air, and ambient air at the fresh air intake, for carbon monoxide (CO), carbon dioxide (CO 2), total volatile organic compounds (TVOCs), and particulates (including PM10).

Technologies /Strategies: Provide action plan for periodic system maintenance, monitoring, occupant/manager training.

---

[2] © U. S. Green Building Council. Used by permission.

**6.C1** **Holistic Delivery of Facility**

Intent: Encourage a facility delivery process that actively engages all stakeholders in the design process to deliver a facility that meets all functional requirements while effectively optimizing tradeoffs among sustainability, first costs, life cycle costs and mission requirements.

Requirement:

- ❑ Choose team leaders that are experienced in holistic delivery of facilities. **1**
- ❑ Train the entire team in the holistic delivery process. The team must include all stakeholders in the facility delivery, including the users, the contracting staff, the construction representatives, project manager, and design/engineering team members. **1**
- ❑ Identify project goals and metrics. **1**
- ❑ Plan and execute charrettes with team members at critical phases of the facility delivery. **1**
- ❑ Identify and resolve tradeoffs among sustainability, first costs, life cycle costs and mission requirements through charrettes and other collaborative processes. **2**
- ❑ Document required results for each phase of project deliverables that achieve the project goals and are measurable throughout the facility life span. **1**

Technologies /Strategies:

Develop performance specifications or choose competitive range of products that meet environmental criteria.

Use automated modeling and analysis tools to assess site and facility design alternatives.

Conduct life-cycle cost analysis (LCCA) in the design process according to the Federal Facilities Council Technical Report, Sustainable Federal Facilities: A Guide To Integrating Value Engineering, Life Cycle Costing, and Sustainable Development, FFC # 142, 2000.

Conduct a full ecological assessment to include soil quality, water resources and flows, vegetation and trees, wildlife habitats and corridors, wetlands, and ecologically sensitive areas to identify the least sensitive site areas for development. Evaluate space utilization/functions to reduce overall space requirements, considering networking, flextime, flexi-place, dual-use, and other strategies to reduce space requirements/optimize facility size.

## 7.0 Current Mission — Score 6

### 7.C1 Operation and Maintenance

Intent: Encourage the development of a facility delivery process that enhances efficient operation and maintenance of the facility.

Requirement:

- ❑ Develop a facility operations and maintenance program to include: **2**
  - Commissioning instructions for all facility systems.
  - Comprehensive facility operations and maintenance instructions for system operation, performance verification procedures and results, an equipment inventory, warrantee information, and recommended maintenance schedule. The instructions should include a comprehensive, preventive maintenance program to keep all facility systems functioning as designed.
  - A periodic training program for occupants, facilities managers, and maintenance staff in all facility operations and maintenance activities.
  - Instructions on sustainable cleaning and pest control practices.
  - Develop a comprehensive site/facility recycling/waste management plan.
- ❑ Provide surfaces, furnishings, and equipment that are appropriately durable, according to life cycle cost analysis. **1**

Technologies /Strategies: Maintain facility elements, systems and subsystems on a routine maintenance schedule to ensure integrity and longevity.

Perform scheduled cleaning and maintenance activities with nontoxic environmentally preferable cleaning products and procedures. Keep air ducts clean and free of microorganisms through a structured program of preventive maintenance. Clean lighting systems following a regular maintenance schedule to ensure optimum light output and energy efficiency.

Use pesticides and herbicides sparingly and only when necessary with preference to natural methods and materials over poisons and toxic agents.

Use automated monitors and controls for energy, water, waste, temperature, moisture, and ventilation monitors and controls. Turn off the lights, computers, computer monitors, and equipment when not in use. Enable power-down features on office equipment.

### 7.C2 Soldier and Workforce Productivity and Retention

Intent: Provide a high-quality, functional, healthy and safe work environment to promote soldier and workforce productivity and retention.

Requirement:

- ❑ Provide a high quality indoor environment to enhance user/occupant quality of life (QOL). **1**
- ❑ Provide a highly functional work environment to promote user/occupant work productivity. **1**
- ❑ Provide a healthy and safe work environment to sustain QOL and productivity. **1**

Technologies /Strategies: Use a registered/certified interior designer to provide stimulating interior environments with pleasant colors, surface treatments, room proportions and ceiling heights, external views, natural lighting, and quality detailing for interior furnishings, equipment, materials and finishes. Use IES standards to provide light to occupied space with variations in level, comfortable contrasts, natural color rendition, natural/man-made, and adequate controls to optimize light aesthetic qualities. Provide occupant control of individual work areas configuration, and lighting, thermal and ventilation systems.

Collaborate with end users to identify functional and technical requirements and to perform adjacency studies. Configure occupied space to address the specific workers/occupants functions and activities that will be carried out there. Meet TI 800-01 Design Guide requirements. Design and configure occupied space, and select furniture and equipment using human ergonomics. Identify existing user amenities, such as dining, recreation, socialization, shopping and child care facilities. Identify what amenities should be incorporated into the project or provided in the future, nearby facility. Provide ventilation air in sufficient volume free from natural and man made contaminants.

## 8.0 Future Missions — Score 4

### 8.C1 Functional Life of Facility and Supporting Systems

Intent: Assess the functional life of a facility and its supporting systems to optimize the infrastructure investment.

Requirement:

- ❑ Identify how long the designed function is likely to occupy the current facility. **1**
- ❑ Identify how long the envelope, structure, HVAC, plumbing, communications, electrical, and other systems are likely to last before requiring replacement or upgrade. Consider economic, functional and physical obsolescence. **1**

Technologies /Strategies: Assess the typical or likely lifespan of the function(s) to be accommodated to forecast eventual adaptation to a different use(s). Assess the life spans of the various building systems/components to forecast their revision/replacement during the facility lifespan and design in a manner that facilitates revision/replacement.

Consider the life span of the weapon systems, doctrines, or other programs supported by the facility.

Use life cycle data and other sources to identify the life span of the embodied systems.

### 8.C2 Adaptation, Renewal and Future Uses

Intent: Encourage facility design that is responsive to change over time to maximize accommodation of future uses without creating waste and insuring maximum useful life of products.

Requirement:

- ❑ Identify possible future uses for the facility; consider alternatives that expand the list of possible future uses. AND Design the building to accommodate as wide a range of future uses, as practical. AND Design the installation of building systems to accommodate foreseeable change with a minimum amount of disruption, cost, and additional materials. **1**
- ❑ Build the smallest facility necessary to meet current mission functional requirements, using the most efficient shape and form, while taking into consideration expansion capabilities and potential future mission requirements. AND Design the facility for recycling of materials and systems. **1**

Technologies /Strategies: Create durable, long-lasting and adaptable facility shell and structural system. Create an adaptable, flexible facility design using open planning, service corridors, interstitial space, access floors, demountable walls/partitions, modular furniture and other adaptable space configuration/utilization strategies.

Select materials that are recyclable, avoiding composite materials, such as reinforced plastics and carpet fibers and backing. Consider selecting materials and labeling construction materials with identification information to facilitate recycling. Use pre-cut/pre-fabricated materials and use standard lengths and sizes (dimensional modularity) in design. Design facility systems and subsystems for reconfiguration and/or disassembly/recycling using reversible/reusable connectors.

# Facility Points Summary

| | | | | |
|---|---|---|---|---|
| **1.0** | **Sustainable Sites (S)** | **Score** | **0** | **Max 20** |
| 1.R1 | ❑ Erosion, Sedimentation and Water Quality Control | | | [Required] |
| 1.C1 | ❑ Site Selection | | | 2 |
| 1.C2 | ❑ Installation/Base Redevelopment | | | 2 |
| 1.C3 | ❑ Brownfield Redevelopment | | | 1 |
| 1.C4 | ❑ Alternative Transportation | | | 4 |
| 1.C5 | ❑ Reduced Site Disturbance | | | 2 |
| 1.C6 | ❑ Stormwater Management | | | 2 |
| 1.C7 | ❑ Landscape and Exterior Design to Reduce Heat Islands | | | 2 |
| 1.C8 | ❑ Light Pollution Reduction | | | 1 |
| 1.C9 | ❑ Optimize Site Features | | | 1 |
| 1.C10 | ❑ Facility Impact | | | 2 |
| 1.C11 | ❑ Site Ecology | | | 1 |
| **2.0** | **Water Efficiency (W)** | **Score** | **0** | **Max 5** |
| 2.C1 | ❑ Water Efficient Landscaping | | | 2 |
| 2.C2 | ❑ Innovative Wastewater Technologies | | | 1 |
| 2.C3 | ❑ Water Use Reduction | | | 2 |
| **3.0** | **Energy and Atmosphere (E)** | **Score** | **0** | **Max 28** |
| 3.R1 | ❑ Fundamental Building Systems Commissioning | | | [Required] |
| 3.R2 | ❑ Minimum Energy Performance | | | [Required] |
| 3.R3 | ❑ CFC Reduction in HVAC&R Equipment | | | [Required] |
| 3.C1 | ❑ Optimize Energy Performance | | | 20 |
| 3.C2 | ❑ Renewable Energy | | | 4 |
| 3.C3 | ❑ Additional Commissioning | | | 1 |
| 3.C4 | ❑ <<Deleted>> | | | |
| 3.C5 | ❑ Measurement and Verification | | | 1 |
| 3.C6 | ❑ Green Power | | | 1 |
| 3.C7 | ❑ Distributed Generation | | | 1 |
| **4.0** | **Materials and Resources (M)** | **Score** | **0** | **Max 13** |
| 4.R1 | ❑ Storage & Collection of Recyclables | | | [Required] |
| 4.C1 | ❑ Building Reuse | | | 3 |
| 4.C2 | ❑ Construction Waste Management | | | 2 |
| 4.C3 | ❑ Resource Reuse | | | 2 |
| 4.C4 | ❑ Recycled Content | | | 2 |
| 4.C5 | ❑ Local/Regional Materials | | | 2 |
| 4.C6 | ❑ Rapidly Renewable Materials | | | 1 |
| 4.C7 | ❑ Certified Wood | | | 1 |
| **5.0** | **Indoor Environmental Quality (IEQ) [Q]** | **Score** | **0** | **Max 17** |
| 5.R1 | ❑ Minimum IAQ Performance | | | [Required] |
| 5.R2 | ❑ Environmental Tobacco Smoke (ETS) Control | | | [Required] |
| 5.C1 | ❑ IAQ Monitoring | | | 1 |
| 5.C2 | ❑ Increase Ventilation Effectiveness | | | 1 |
| 5.C3 | ❑ Construction IAQ Management Plan | | | 2 |
| 5.C4 | ❑ Low-Emitting Materials | | | 4 |
| 5.C5 | ❑ Indoor Chemical and Pollutant Source Control | | | 1 |
| 5.C6 | ❑ Controllability of Systems | | | 2 |
| 5.C7 | ❑ Thermal Comfort | | | 2 |
| 5.C8 | ❑ Daylight and Views | | | 2 |
| 5.C9 | ❑ Acoustic Environment /Noise Control | | | 1 |
| 5.C10 | ❑ Facility In-Use IAQ Management Plan | | | 1 |

## Facility Points Summary (Continued)

| | | | | Maximum Points |
|---|---|---|---|---|
| 6.0 | Facility Delivery Process (P) | Score | 0 | Max 7 |
| 6.C1 | ❑ Holistic Delivery of Facility | | | 7 |
| 7.0 | Current Mission | Score | 0 | Max 6 |
| 7.C1 | ❑ Operation and Maintenance | | | 3 |
| 7.C2 | ❑ Soldier and Workforce Productivity and Retention | | | 3 |
| 8.0 | Future Missions | Score | 0 | Max 4 |
| 8.C1 | ❑ Functional Life of Facility and Supporting Systems | | | 2 |
| 8.C2 | ❑ Adaptation, Renewal and Future Uses | | | 2 |

PROPOSAL DATA SHEET

**PROPOSAL DATA SHEET**
[PROJECT TITLE]
[PROJECT LOCATION]

| Note to Design Activity |
| --- |
| Inclusion of the Performance Capability Data Sheet in the RFP is the USACE design activity's option. Requirements for demonstration of offeror capability are stated in the RFP Section 00110. The performance capability evaluation is also referred to as STEP 1 in RFP Section 00120, EVALUATION CRITERIA FOR TECHNICAL PROPOSALS. When using the following coordinate with APPENDIX A of the Project Management Manual (Volume 1), STEP 1 OFFEROR PROPOSAL EVALUATION MANUAL. |

| Note to Offerors |
| --- |
| This OFFEROR PERFORMANCE CAPABILITY PROPOSAL DATA SHEET must be completed and attached as the first page of the body of your proposal. The information required by this data sheet may be completed directly on this form or attached to the form as supplemental data sheets. |

**1. NAME OF OFFEROR.**

Name of Offeror(s):

If a joint venture or contractor-subcontractor association of firms, list the individual firms and briefly describe the nature of the association.

Firm 1:
Firm 2:
Firm 3:
Firm 4:

Nature of Association:

**2. AUTHORIZED NEGOTIATORS.** FAR 52.215-11

The offeror or quoter represents that the following persons are authorized to negotiate on its behalf with the Government in connection with this Request for Proposals (RFP) or quotations.

[List names, titles, and telephone number of the authorized negotiator.]

Name of Person Authorized to Negotiate:

Contact's Address:

Contact's Telephone:

**PROPONENT.** If different from 2. above.

Name:
Address:

Telephone:

**3. PROJECT EXAMPLES.** On an attached sheet, list (preferably three) projects of similar design that have been done by the offeror. List date of construction completion, address of building(s), address and telephone number of owner. Indicate type of project (private sector, Government, planned unit development, etc.), general character, total cost, and total cost of all modifications. If offeror is made up of separate design and construction companies that have combined for this project, then this item must be completed twice (once for each company).

a. On an attached sheet, list any projects within the last five years that have been assessed liquidated damages. Provide explanation.

b. On an attached sheet, list any projects within the last five years that have been terminated. Provide explanation.

c. On an attached sheet, list all contracts with the Government within the last five years. Indicate Government contract number and contracting agency (with contact names and telephone numbers).

**4. PERSONNEL WITH PRINCIPAL RESPONSIBILITY.** Include a brief resume for each person listed on an attached sheet.

| KEY DESIGN PERSONNEL | | |
|---|---|---|
| Position | Name | State of Registration |
| Project Manager | | |
| Architect | | |
| Landscape Architect | | |
| Structural Engineer | | |
| Electrical Engineer | | |
| Mechanical Engineer | | |
| Civil/Site Engineer | | |
| Geotechnical Engineer | | |
| Other (e.g., Kitchen Designer) | | |

| KEY CONSTRUCTION PERSONNEL | | |
|---|---|---|
| Position | Name | Type of Registration & State |
| Quality Control Manager | | |
| Construction Manager | | |
| Superintendent (if different) | | |

a. On a separate sheet, list current contracts by nature, duration, and amount, including those for which your firm is now competing or negotiating. Describe the impact of such work on this project if you are determined to be the successful proposer. Furnish a curve with the record of placement of your firm over the past three years, and your projection for the next two years. Provide a statement of the priority of this project relative to other current and anticipated commitments. Indicate the type and extent of home office support you contemplate for this project on a regular and contingency basis.

b. Indicate the approximate number of people currently on company payroll in design and construction.

c. Indicate the approximate number of people you think will be available to work on this project in both design and construction.

d. Indicate the approximate workload currently in your office in both design and construction.

(1) In Design:_____No. Projects: _____ U.S. Dollar Volume:

(2) In Construction:_____ No. Projects: _____ U.S. Dollar Volume:

e. Indicate your office capabilities for using CADD (Computer Aided Design and Drafting) and other forms of automation on this project.

f. You may provide additional information on your capabilities, but please be brief.

**5. MANAGEMENT PLAN AND QUALITY CONTROL PLAN.** Provide your Management Plan. The term "Management Plan" is defined as a plan that includes the following subplans:

Quality Control Plan.
Design Schedule.
Construction Schedule (Network Analysis).
Contract Closeout Plan.

**6. OTHER FACTORS.**

a. Has the offeror's staff visited the project site?

b. Did offeror attend pre-proposal site visit?

UNDERWRITERS LABORATORIES (UL)

UL 586 (1996; Rev thru Aug 1999) High-Efficiency, Particulate, Air Filter Units

1.2 DEFINITIONS

a. Adequately Wet: A term defined in 40 CFR 61, Subpart M, and EPA 340/1-90/019 meaning to sufficiently mix or penetrate with liquid to prevent the release of particulate. If visible emissions are observed coming from asbestos-containing material (ACM), then that material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wetted.

b. Aggressive Method: Removal or disturbance of building material by sanding, abrading, grinding, or other method that breaks, crumbles, or disintegrates intact asbestos-containing material (ACM).

c. Amended Water: Water containing a wetting agent or surfactant with a surface tension of at least 29 dynes per square centimeter when tested in accordance with ASTM D 1331.

d. Asbestos: Asbestos includes chrysotile, amosite, crocidolite, tremolite asbestos, anthophylite asbestos, actinolite asbestos, and any of these minerals that have been chemically treated and/or altered.

e. Asbestos-Containing Material (ACM): Any materials containing more than one percent asbestos.

f. Asbestos Fiber: A particulate form of asbestos, 5 micrometers or longer, with a length-to-width ratio of at least 3 to 1.

g. Authorized Person: Any person authorized by the Contractor and required by work duties to be present in the regulated areas.

h. Building Inspector: Individual who inspects buildings for asbestos and has EPA Model Accreditation Plan (MAP) "Building Inspector" training; accreditation required by 40 CFR 763, Subpart E, Appendix C.

i. Certified Industrial Hygienist (CIH): An Industrial Hygienist certified in the practice of industrial hygiene by the American Board of Industrial Hygiene.

j. Class I Asbestos Work: Activities defined by OSHA involving the removal of thermal system insulation (TSI) and surfacing ACM.

k. Class II Asbestos Work: Activities defined by OSHA involving the removal of ACM which is not thermal system insulation or surfacing material. This includes, but is not limited to, the removal of asbestos - containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastic. Certain "incidental" roofing materials such as mastic, flashing and cements when they are still intact are excluded from Class II asbestos work. Removal of small amounts of these materials which would fit into a glovebag may be classified as a Class III job.

l. Class III Asbestos Work: Activities defined by OSHA that involve repair and maintenance operations, where ACM, including TSI and surfacing ACM, is likely to be disturbed. Operations may include drilling, abrading, cutting a hole, cable pulling, crawling through tunnels or attics and spaces above the ceiling, where asbestos is actively disturbed or asbestos-containing debris is actively disturbed.

m. Class IV Asbestos Work: Maintenance and custodial construction activities during which employees contact but do not disturb ACM and activities to clean-up dust, waste and debris resulting from Class I, II, and III activities. This may include dusting surfaces where ACM waste and debris and accompanying dust exists and cleaning up loose ACM debris from TSI or surfacing ACM following construction.

n. Clean room: An uncontaminated room having facilities for the storage of employees' street clothing and uncontaminated materials and equipment.

o. Competent Person: In addition to the definition in 29 CFR 1926, Section .32(f), a person who is capable of identifying existing asbestos hazards as defined in 29 CFR 1926, Section .1101, selecting the appropriate control strategy, has the authority to take prompt corrective measures to eliminate them and has EPA Model Accreditation Plan (MAP) "Contractor/Supervisor" training; accreditation required by 40 CFR 763, Subpart E, Appendix C.

p. Contractor/Supervisor: Individual who supervises asbestos abatement work and has EPA Model Accreditation Plan "Contractor/Supervisor" training; accreditation required by 40 CFR 763, Subpart E, Appendix C.

q. Critical Barrier: One or more layers of plastic sealed over all openings into a regulated area or any other similarly placed physical barrier sufficient to prevent airborne asbestos in a regulated area from migrating to an adjacent area.

r. Decontamination Area: An enclosed area adjacent and connected to the regulated area and consisting of an equipment room, shower area, and clean room, which is used for the decontamination of workers, materials, and equipment that are contaminated with asbestos.

s. Demolition: The wrecking or taking out of any load-supporting structural member and any related razing, removing, or stripping of asbestos products.

t. Disposal Bag: A 6 mil thick, leak-tight plastic bag, pre-labeled in accordance with 29 CFR 1926, Section .1101, used for transporting asbestos waste from containment to disposal site.

u. Disturbance: Activities that disrupt the matrix of ACM, crumble or pulverize ACM, or generate visible debris from ACM. Disturbance includes cutting away small amounts of ACM, no greater than the amount which can be contained in 1 standard sized glovebag or waste bag, not larger than 60 inches in length and width in order to access a building component.

v. Equipment Room or Area: An area adjacent to the regulated area used for the decontamination of employees and their equipment.

w. Employee Exposure: That exposure to airborne asbestos that would occur if the employee were not using respiratory protective equipment.

x. Fiber: A fibrous particulate, 5 micrometers or longer, with a length to width ratio of at least 3 to 1.

y. Friable ACM: A term defined in 40 CFR 61, Subpart M and EPA 340/1-90/018 meaning any material which contains more than 1 percent asbestos, as determined using the method specified in 40 CFR 763, Subpart E, Appendix A, Section 1, Polarized Light Microscopy (PLM), that when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent, as determined by a method other than point counting by PLM, the asbestos content is verified by point counting using PLM.

z. Glovebag: Not more than a 60 by 60 inch impervious plastic bag-like enclosure affixed around an asbestos-containing material, with glove-like appendages through which material and tools may be handled.

aa. High-Efficiency Particulate Air (HEPA) Filter: A filter capable of trapping and retaining at least 99.97 percent of all mono-dispersed particles of 0.3 micrometers in diameter.

bb. Homogeneous Area: An area of surfacing material or thermal system insulation that is uniform in color and texture.

cc. Industrial Hygienist: A professional qualified by education, training, and experience to anticipate, recognize, evaluate, and develop controls for occupational health hazards.

dd. Intact: ACM which has not crumbled, been pulverized, or otherwise deteriorated so that the asbestos is no longer likely to be bound with its matrix. Removal of "intact" asphaltic, resinous, cementitious products does not render the ACM non-intact simply by being separated into smaller pieces.

ee. Model Accreditation Plan (MAP): USEPA training accreditation requirements for persons who work with asbestos as specified in 40 CFR 763, Subpart E, Appendix C.

ff. Modification: A changed or altered procedure, material or component of a control system, which replaces a procedure, material or component of a required system.

gg. Negative Exposure Assessment: A demonstration by the Contractor to show that employee exposure during an operation is expected to be consistently below the OSHA Permissible Exposure Limits (PELs).

hh. NESHAP: National Emission Standards for Hazardous Air Pollutants. The USEPA NESHAP regulation for asbestos is at 40 CFR 61, Subpart M.

ii. Nonfriable ACM: A NESHAP term defined in 40 CFR 61, Subpart M

and EPA 340/1-90/018 meaning any material containing more than 1 percent asbestos, as determined using the method specified in 40 CFR 763, Subpart E, Appendix A, Section 1, Polarized Light Microscopy, that, when dry, cannot be crumbled, pulverized or reduced to powder by hand pressure.

jj. Nonfriable ACM (Category I): A NESHAP term defined in 40 CFR 61, Subpart E and EPA 340/1-90/018 meaning asbestos-containing packings, gaskets, resilient floor covering, and asphalt roofing products containing more than 1 percent asbestos as determined using the method specified in 40 CFR 763, Subpart F, Appendix A, Section 1, Polarized Light Microscopy.

kk. Nonfriable ACM (Category II): A NESHAP term defined in 40 CFR 61, Subpart E and EPA 340/1-90/018 meaning any material, excluding Category I nonfriable ACM, containing more than 1 percent asbestos, as determined using the methods specified in 40 CFR 763, Subpart F, Appendix A, Section 1, Polarized Light Microscopy, that when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

ll. Permissible Exposure Limits (PELs):

(1) PEL-Time weighted average(TWA): Concentration of asbestos not in excess of 0.1 fibers per cubic centimeter of air (f/cc) as an 8 hour time weighted average (TWA), as determined by the method prescribed in 29 CFR 1926, Section .1101, Appendix A, or the current version of NIOSH Pub No. 84-100 analytical method 7400.

(2) PEL-Excursion Limit: An airborne concentration of asbestos not in excess of 1.0 f/cc of air as averaged over a sampling period of 30 minutes as determined by the method prescribed in 29 CFR 1926, Section .1101, Appendix A, or the current version of NIOSH Pub No. 84-100 analytical method 7400.

mm. Regulated Area: An OSHA term defined in 29 CFR 1926, Section .1101 meaning an area established by the Contractor to demarcate areas where Class I, II, and III asbestos work is conducted; also any adjoining area where debris and waste from such asbestos work accumulate; and an area within which airborne concentrations of asbestos exceed, or there is a reasonable possibility they may exceed, the permissible exposure limit.

nn. Removal: All operations where ACM is taken out or stripped from structures or substrates, and includes demolition operations.

oo. Repair: Overhauling, rebuilding, reconstructing, or reconditioning of structures or substrates, including encapsulation or other repair of ACM attached to structures or substrates. If the amount of asbestos so "disturbed" cannot be contained in 1 standard glovebag or waste bag, Class I precautions are required.

pp. Spills/Emergency Cleanups: Cleanup of sizable amounts of asbestos waste and debris which has occurred, for example, when water damage occurs in a building, and sizable amounts of ACM are dislodged. A Competent Person evaluates the site and ACM to be handled, and based on the type, condition and extent of the dislodged material, classifies the cleanup as Class I, II, or III.

Only if the material was intact and the cleanup involves mere contact of ACM, rather than disturbance, could there be a Class IV classification.

qq. Surfacing ACM: Asbestos-containing material which contains more than 1% asbestos and is sprayed-on, troweled-on, or otherwise applied to surfaces, such as acoustical plaster on ceilings and fireproofing materials on structural members, or other materials on surfaces for acoustical, fireproofing, or other purposes.

rr. Thermal system insulation (TSI) ACM: ACM which contains more than 1% asbestos and is applied to pipes, fittings, boilers, breeching, tanks, ducts, or other interior structural components to prevent heat loss or gain or water condensation.

ss. Transite: A generic name for asbestos cement wallboard and pipe.

tt. Worker: Individual (not designated as the Competent Person or a supervisor) who performs asbestos work and has completed asbestos worker training required by 29 CFR 1926, Section .1101, to include EPA Model Accreditation Plan (MAP) "Worker" training; accreditation required by 40 CFR 763, Subpart E, Appendix C, if required by the OSHA Class of work to be performed or by the state where the work is to be performed.

## 1.3 DESCRIPTION OF WORK

The work covered by this section includes the removal of asbestos-containing materials (ACM) which are encountered during demolition for the renovation activities associated with this project and describes procedures and equipment required to protect workers and occupants of the regulated area from contact with airborne asbestos fibers and ACM dust and debris. Activities include OSHA Class II work operations involving ACM. The work also includes containment, storage, transportation and disposal of the generated ACM wastes. More specific operational procedures shall be detailed in the required Accident Prevention Plan and its subcomponents, the Asbestos Hazard Abatement Plan and Activity Hazard Analyses required in paragraph SAFETY AND HEALTH PROGRAM AND PLANS.

### 1.3.1 Abatement Work Tasks

The specific ACM to be abated is identified on the detailed plans and project drawings. A summary of work task data elements for each individual ACM abatement work task to include the appropriate RESPONSE ACTION DETAIL SHEET (item to be abated and methods to be used) and SET-UP DETAIL SHEETS (containment techniques to include safety precautions and methods) is included in Table 1, "Individual Work Task Data Elements" at the end of this section.

### 1.3.2 Unexpected Discovery of Asbestos

For any previously untested building components suspected to contain asbestos and located in areas impacted by the work, the Contractor shall notify the Contracting Officer (CO) who will have the option of ordering up to 10 bulk samples to be obtained at the Contractor's expense and delivered to a laboratory accredited under the National Institute of Standards and Technology (NIST) "National Voluntary Laboratory Accreditation Program (NVLAP)" and analyzed by PLM at no additional cost to the Government. Any additional components identified as ACM that have been approved by the

Contracting Officer for removal shall be removed by the Contractor and will be paid for by an equitable adjustment to the contract price under the CONTRACT CLAUSE titled "changes". Sampling activities undertaken to determine the presence of additional ACM shall be conducted by personnel who have successfully completed the EPA Model Accreditation Plan (MAP) "Building Inspector" training course required by 40 CFR 763, Subpart E, Appendix C.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES:

SD-03 Product Data

Respiratory Protection Program

Records of the respirator program.

Cleanup and Disposal

Waste shipment records. Weigh bills and delivery tickets shall be furnished for information only.

Detailed Drawings

Descriptions, detail project drawings, and site layout to include worksite containment area techniques as prescribed on applicable SET-UP DETAIL SHEETS, local exhaust ventilation system locations, decontamination units and load-out units, other temporary waste storage facility, access tunnels, location of temporary utilities (electrical, water, sewer) and boundaries of each regulated area.

Materials and Equipment

Manufacturer's catalog data for all materials and equipment to be used in the work, including brand name, model, capacity, performance characteristics and any other pertinent information. Test results and certificates from the manufacturer of encapsulants substantiating compliance with performance requirements of this specification. Material Safety Data Sheets for all chemicals to be used onsite in the same format as implemented in the Contractor's HAZARD COMMUNICATION PROGRAM. Data shall include, but shall not be limited to, the following items:

a. High Efficiency Filtered Air (HEPA) local exhaust equipment

b. Vacuum cleaning equipment

c. Pressure differential monitor for HEPA local exhaust equipment

d. Air monitoring equipment

e. Respirators

f. Personal protective clothing and equipment

(1) Coveralls
(2) Foot coverings
(3) Hard hats
(4) Eye protection
(5) Other items required and approved by Contractors Designated IH and Competent Person

g. Duct Tape

h. Disposal Containers

(1) Disposal bags

i. Sheet Plastic

(1) Polyethylene Sheet - General

j. Wetting Agent

(1) Amended Water
(2) Removal encapsulant

k. Prefabricated Decontamination Unit

l. Other items

m. Material Safety Data Sheets (for all chemicals proposed)

Qualifications; G

A written report providing evidence of qualifications for personnel, facilities and equipment assigned to the work.

Training Program

A copy of the written project site-specific training material as indicated in 29 CFR 1926, Section .1101 that will be used to train onsite employees. The training document shall be signed by the Contractor's Designated IH and Competent Person.

Medical Requirements

Physician's written opinion.

Encapsulants

Certificates stating that encapsulants meet the applicable specified performance requirements.

SD-06 Test Reports

Exposure Assessment and Air Monitoring

Initial exposure assessments, negative exposure assessments,

air-monitoring results and documentation.

Local Exhaust Ventilation

Pressure differential recordings.

Licenses, Permits and Notifications

Licenses, permits, and notifications.

SD-07 Certificates

Vacuum, Filtrationand Ventilation Equipment
Manufacturer's certifications showing compliance with ANSI Z9.2 for:

a. Vacuums.

b. Water filtration equipment.

c. Ventilation equipment.

d. Other equipment required to contain airborne asbestos fibers.

## 1.5 QUALIFICATIONS

### 1.5.1 Written Qualifications and Organization Report

The Contractor shall furnish a written qualifications and organization report providing evidence of qualifications of the Contractor, Contractor's Project Supervisor, Designated Competent Person, supervisors and workers; Designated IH (person assigned to project and firm name); independent testing laboratory (including name of firm, principal, and analysts who will perform analyses); all subcontractors to be used including disposal transportation and disposal facility firms, subcontractor supervisors, subcontractor workers; and any others assigned to perform asbestos abatement and support activities. The report shall include an organization chart showing the Contractor's staff organization for this project by name and title, chain of command and reporting relationship with all subcontractors. The report shall be signed by the Contractor, the Contractor's onsite project manager, Designated Competent Person, Designated IH, designated testing laboratory and the principals of all subcontractors to be used. The Contractor shall include the following statement in the report: "By signing this report I certify that the personnel I am responsible for during the course of this project fully understand the contents of 29 CFR 1926, Section .1101, 40 CFR 61, Subpart M, and the federal, state and local requirements specified in paragraph SAFETY AND HEALTH PROGRAM AND PLANS for those asbestos abatement activities that they will be involved in."

### 1.5.2 Specific Requirements

The Contractor shall designate in writing, personnel meeting the following qualifications:

a. Designated Competent Person: The name, address, telephone number, and resume of the Contractor's Designated Competent Person shall be provided. Evidence that the full-time Designated Competent Person is qualified in accordance with 29 CFR 1926, Sections .32

and .1101, has EPA Model Accreditation Plan (MAP) "Contractor/Supervisor" training accreditation required by 40 CFR 763, Subpart E, Appendix C, and HAR Chapter 504 and is experienced in the administration and supervision of asbestos abatement projects, including exposure assessment and monitoring, work practices, abatement methods, protective measures for personnel, setting up and inspecting asbestos abatement work areas, evaluating the integrity of containment barriers, placement and operation of local exhaust systems, ACM generated waste containment and disposal procedures, decontamination units installation and maintenance requirements, site safety and health requirements, notification of other employees onsite, etc. The duties of the Competent Person shall include the following: controlling entry to and exit from the regulated area; supervising any employee exposure monitoring required by 29 CFR 1926, Section .1101; ensuring that all employees working within a regulated area wear the appropriate personal protective equipment (PPE), are trained in the use of appropriate methods of exposure control, and use the hygiene facilities and decontamination procedures specified; and ensuring that engineering controls in use are in proper operating conditions and are functioning properly. The Designated Competent Person shall be responsible for compliance with applicable federal, state and local requirements, the Contractor's Accident Prevention Plan and Asbestos Hazard Abatement Plan. The Designated Competent Person shall provide, and the Contractor shall submit, the "Contractor/Supervisor" course completion certificate and the most recent certificate for required refresher training with the employee "Certificate of Worker Acknowledgment" required by this paragraph. The Contractor shall submit evidence that this person has a minimum of 2 years of on-the-job asbestos abatement experience relevant to OSHA competent person requirements. The Designated Competent Person shall be onsite at all times during the conduct of this project.

b. Project and Other Supervisors: The Contractor shall provide the name, address, telephone number, and resume of the Project Supervisor and other supervisors who have responsibility to implement the Accident Prevention Plan, including the Asbestos Hazard Abatement Plan and Activity Hazard Analyses, the authority to direct work performed under this contract and verify compliance, and have EPA Model Accreditation Plan (MAP) "Contractor/Supervisor" training accreditation required by 40 CFR 763, Subpart E, Appendix C. The Project Supervisor and other supervisors shall provide, and the Contractor shall submit, the "Contractor/Supervisor" course completion certificate and the most recent certificate for required refresher training with the employee "Certificate of Worker Acknowledgment" required by this paragraph. The Contractor shall submit evidence that the Project Supervisor has a minimum of 2 years of on-the-job asbestos abatement experience relevant to project supervisor responsibilities and the other supervisors have a minimum of 2 years on-the-job asbestos abatement experience commensurate with the responsibilities they will have on this project.

c. Designated Industrial Hygienist: The Contractor shall provide the name, address, telephone number, resume and other information specified below for the Industrial Hygienist (IH) selected to prepare the Contractor's Asbestos Hazard Abatement Plan, prepare and perform training, direct air monitoring and assist the

Contractor's Competent Person in implementing and ensuring that safety and health requirements are complied with during the performance of all required work. The Designated IH shall be a person who is board eligible (meets all education and experience requirements) as determined and documented by the American Board of Industrial Hygiene (ABIH), has EPA Model Accreditation Plan (MAP) "Contractor/Supervisor" training accreditation required by 40 CFR 763, Subpart E, Appendix C, and has a minimum of 2 years of comprehensive experience in planning and overseeing asbestos abatement activities. The Designated IH shall provide, and the Contractor shall submit, the "Contractor/Supervisor" course completion certificate and the most recent certificate for required refresher training with the employee "Certificate of Worker Acknowledgment" required by this paragraph. The Designated IH shall be completely independent from the Contractor according to federal, state, or local regulations; that is, shall not be a Contractor's employee or be an employee or principal of a firm in a business relationship with the Contractor negating such independent status. A copy of the Designated IH's current educational Diplomas, valid ABIH confirmation of eligibility in writing from the ABIH shall be included. The Designated IH shall be onsite at all times, visit the site at least 1 per week for the duration of asbestos activities and shall be available for emergencies. In addition, the Designated IH shall prepare, and the Contractor shall submit, the name, address, telephone numbers and resumes of additional IH's and industrial hygiene technicians (IHT) who will be assisting the Designated IH in performing onsite tasks. IHs and IHTs supporting the Designated IH shall have a minimum of 2 years of practical onsite asbestos abatement experience. The formal reporting relationship between the Designated IH and the support IHs and IHTs, the Designated Competent Person, and the Contractor shall be indicated.

d. Asbestos Abatement Workers: Asbestos abatement workers shall meet the requirements contained in 29 CFR 1926, Section .1101, 40 CFR 61, Subpart M, and other applicable federal, state HAR Chapter 501, HAR Chapter 502, HAR Chapter 503, HAR Chapter 504 and local requirements. Worker training documentation shall be provided as required on the "Certificate of Workers Acknowledgment" in this paragraph.

e. Worker Training and Certification of Worker Acknowledgment: Training documentation will be required for each employee who will perform OSHA Class I, Class II, Class III, or Class IV asbestos abatement operations. Such documentation shall be submitted on a Contractor generated form titled "Certificate of Workers Acknowledgment", to be completed for each employee in the same format and containing the same information as the example certificate at the end of this section. Training course completion certificates (initial and most recent update refresher) required by the information checked on the form shall be attached.

f. Physician: The Contractor shall provide the name, medical qualifications, address, telephone number and resume of the physician who will or has performed the medical examinations and evaluations of the persons who will conduct the asbestos abatement work tasks. The physician shall be currently licensed by the state where the workers will be or have been examined, have expertise in pneumoconiosis and shall be responsible for the

determination of medical surveillance protocols and for review of examination/test results performed in compliance with 29 CFR 1926, Section .1101 and paragraph MEDICAL REQUIREMENTS. The physician shall be familiar with the site's hazards and the scope of this project.

g. First Aid and CPR Trained Persons: The names of at least 2 persons who are currently trained in first aid and CPR by the American Red Cross or other approved agency shall be designated and shall be onsite at all times during site operations preferably the forman. They shall be trained in universal precautions and the use of PPE as described in the Bloodborne Pathogens Standard of 29 CFR 1910, Section .1030 and shall be included in the Contractor's Bloodborne Pathogen Program. These persons may perform other duties but shall be immediately available to render first aid when needed. A copy of each designated person's current valid First Aid and CPR certificate shall be provided.

h. Independent Testing Laboratory: The Contractor shall provide the name, address and telephone number of the independent testing laboratory selected to perform the sample analyses and report the results. The testing laboratory shall be registered with the State of Hawaii Department of Health completely independent from the Contractor as recognized by federal, state or local regulations. Written verification of the following criteria, signed by the testing laboratory principal and the Contractor, shall be submitted:

(1) Phase contrast microscopy (PCM): The laboratory is fully equipped and proficient in conducting PCM of airborne samples using the methods specified by 29 CFR 1926, Section .1101, OSHA method ID-160, the most current version of NIOSH Pub No. 84-100 Method 7400; the laboratory is currently judged proficient (classified as acceptable) in counting airborne asbestos samples by PCM by successful participation in each of the last 4 rounds in the American Industrial Hygiene Association (AIHA) Proficiency Analytical Testing (PAT) Program; the names of the selected microscopists who will analyze airborne samples by PCM with verified documentation of their proficiency to conduct PCM analyses by being judged proficient in counting samples as current participating analysts in the AIHA PAT Program, and having successfully completed the Asbestos Sampling and Analysis course (NIOSH 582 or equivalent) with a copy of course completion certificate provided; when the PCM analysis is to be conducted onsite, documentation shall be provided certifying that the onsite analyst meets the same requirements.

(2) Polarized light microscopy (PLM): The laboratory is fully equipped and proficient in conducting PLM analyses of suspect ACM bulk samples in accordance with 40 CFR 763, Subpart E, Appendix E; the laboratory is currently accredited by NIST under the NVLAP for bulk asbestos analysis and will use analysts (names shall be provided) with demonstrated proficiency to conduct PLM to include its application to the identification and quantification of asbestos content.

(3) PCM: The laboratory is fully equipped and each analyst (name shall be provided) possesses demonstrated proficiency in conducting PCM analysis of airborne samples using NIOSH Pub No.

84-100Method 7400 PCM.

i. Disposal Facility, Transporter: The Contractor shall provide written evidence that the landfill to be used is approved for asbestos disposal by the USEPA and state and local regulatory agencies. Copies of signed agreements between the Contractor (including subcontractors and transporters) and the asbestos waste disposal facility to accept and dispose of all asbestos containing waste generated during the performance of this contract shall be provided. Qualifications shall be provided for each subcontractor or transporter to be used, indicating previous experience in transport and disposal of asbestos waste to include all required state and local waste hauler requirements for asbestos. The Contractor and transporters shall meet the DOT requirements of 49 CFR 171, 49 CFR 172, and 49 CFR 173 as well as registration requirements of 49 CFR 107 and other applicable state or local requirements. The disposal facility shall meet the requirements of 40 CFR 61, Sections .154 or .155, as required in 40 CFR 61, Section .150(b), and other applicable state or local requirements.

### 1.5.3 Federal, State or Local Citations on Previous Projects

The Contractor and all subcontractors shall submit a statement, signed by an officer of the company, containing a record of any citations issued by Federal, State or local regulatory agencies relating to asbestos activities (including projects, dates, and resolutions); a list of penalties incurred through non-compliance with asbestos project specifications, including liquidated damages, overruns in scheduled time limitations and resolutions; and situations in which an asbestos-related contract has been terminated (including projects, dates, and reasons for terminations). If there are none, a negative declaration signed by an officer of the company shall be provided.

## 1.6 REGULATORY REQUIREMENTS

In addition to detailed requirements of this specification, work performed under this contract shall comply with EM 385-1-1, applicable federal, state, and local laws, ordinances, criteria, rules and regulations regarding handling, storing, transporting, and disposing of asbestos waste materials. This includes, but is not limited to, OSHA standards, 29 CFR 1926, especially Section .1101, 40 CFR 61, Subpart M and 40 CFR 763. Matters of interpretation of standards shall be submitted to the appropriate administrative agency for resolution before starting work. Where the requirements of this specification, applicable laws, criteria, ordinances, regulations, and referenced documents vary, the most stringent requirements shall apply. The following state and local laws, rules and regulations regarding demolition, removal, encapsulation, construction alteration, repair, maintenance, renovation, spill/emergency cleanup, housekeeping, handling, storing, transporting and disposing of asbestos material apply: HIOSH 12-145 and HAR Chapter 501, HAR Chapter 502, HAR Chapter 503, HAR Chapter 504.

## 1.7 SAFETY AND HEALTH PROGRAM AND PLANS

The Contractor shall develop and submit a written comprehensive site-specific Accident Prevention Plan at least 30 days prior to the preconstruction conference. The Accident Prevention Plan shall address requirements of EM 385-1-1, Appendix A, covering onsite work to be performed by the Contractor and subcontractors. The Accident Prevention

Plan shall incorporate an Asbestos Hazard Abatement Plan, and Activity Hazard Analyses as separate appendices into 1 site specific Accident Prevention Plan document. Any portions of the Contractor's overall Safety and Health Program that are referenced in the Accident Prevention Plan, e.g., respirator program, hazard communication program, confined space entry program, etc., shall be included as appendices to the Accident Prevention Plan. The plan shall take into consideration all the individual asbestos abatement work tasks identified in Table 1. The plan shall be prepared, signed (and sealed, including certification number if required), and dated by the Contractor's Designated IH, Competent Person, and Project Supervisor.

1.7.1 Asbestos Hazard Abatement Plan Appendix

The Asbestos Hazard Abatement Plan appendix to the Accident Prevention Plan shall include, but not be limited to, the following:

a. The personal protective equipment to be used;

b. The location and description of regulated areas including clean and dirty areas,access tunnels, and decontamination unit (clean room, shower room, equipment room, storage areas such as load-out unit);

c. Initial exposure assessment in accordance with 29 CFR 1926, Section .1101;

d. Level of supervision;

e. Method of notification of other employers at the worksite;

f. Abatement method to include containment and control procedures;

g. Interface of trades involved in the construction;

h. Sequencing of asbestos related work;

i. Storage and disposal procedures and plan;

j. Type of wetting agent and asbestos encapsulant to be used;

k. Location of local exhaust equipment;

l. Air monitoring methods (personal, environmental and clearance);

m. Bulk sampling and analytical methods (if required);

n. A detailed description of the method to be employed in order to control the spread of ACM wastes and airborne fiber concentrations;

o. Fire and medical emergency response procedures;

p. The security procedures to be used for all regulated areas.

1.7.2 Activity Hazard Analyses Appendix

Activity Hazard Analyses, for each major phase of work, shall be submitted and updated during the project. The Activity Hazard Analyses format shall be in accordance with EM 385-1-1 (Figure 1-1). The analysis shall define

the activities to be performed for a major phase of work, identify the sequence of work, the specific hazards anticipated, and the control measures to be implemented to eliminate or reduce each hazard to an acceptable level. Work shall not proceed on that phase until the Activity Hazard Analyses has been accepted and a preparatory meeting has been conducted by the Contractor to discuss its contents with everyone engaged in the activities, including the onsite Government representatives. The Activity Hazard Analyses shall be continuously reviewed and, when appropriate, modified to address changing site conditions or operations.

## 1.8 PRECONSTRUCTION CONFERENCE AND ONSITE SAFETY

The Contractor and the Contractor's Designated Competent Person, Project Supervisor, and Designated IH shall meet with the Contracting Officer prior to beginning work at a safety preconstruction conference to discuss the details of the Contractor's submitted Accident Prevention Plan to include the Asbestos Hazard Abatement Plan and Activity Hazard Analyses appendices. Deficiencies in the Accident Prevention Plan will be discussed and the Accident Prevention Plan shall be revised to correct the deficiencies and resubmitted for acceptance. Any changes required in the specification as a result of the Accident Prevention Plan shall be identified specifically in the plan to allow for free discussion and acceptance by the Contracting Officer, prior to the start of work. Onsite work shall not begin until the Accident Prevention Plan has been accepted. A copy of the written Accident Prevention Plan shall be maintained onsite. Changes and modifications to the accepted Accident Prevention Plan shall be made with the knowledge and concurrence of the Designated IH, the Project Supervisor, Designated Competent Person, and the Contracting Officer. Should any unforeseen hazard become evident during the performance of the work, the Designated IH shall bring such hazard to the attention of the Project Supervisor, Designated Competent Person, and the Contracting Officer, both verbally and in writing, for resolution as soon as possible. In the interim, all necessary action shall be taken by the Contractor to restore and maintain safe working conditions in order to safeguard onsite personnel, visitors, the public, and the environment. Once accepted by the Contracting Officer, the Accident Prevention Plan, including the Asbestos Hazard Abatement Plan and Activity Hazard Analyses will be enforced as if an addition to the contract. Disregarding the provisions of this contract or the accepted Accident Prevention Plan will be cause for stopping of work, at the discretion of the Contracting Officer, until the matter has been rectified.

## 1.9 SECURITY

The Contractor shall have sole control over entry and exit from worksite of each regulated area. A log book shall be kept documenting entry into and out of the regulated area. Entry into regulated areas shall only be by personnel authorized by the Contractor and the Contracting Officer. Personnel authorized to enter regulated areas shall be trained, be medically evaluated, and wear the required personal protective equipment for the specific regulated area to be entered.

## 1.10 MEDICAL REQUIREMENTS

Medical requirements shall conform to 29 CFR 1926, Section .1101.

### 1.10.1 Medical Examinations

Before being exposed to airborne asbestos fibers, workers shall be provided with a medical examination as required by 29 CFR 1926, Section .1101 and

other pertinent state or local requirements. This requirement shall have been satisfied within the last 12 months. The same medical examination shall be given on an annual basis to employees engaged in an occupation involving asbestos and within 30 calendar days before or after the termination of employment in such occupation. X-ray films of asbestos workers shall be identified to the consulting radiologist and medical record jackets shall be marked with the word "asbestos."

1.10.1.1 Information Provided to the Physician

The Contractor shall provide the following information in writing to the examining physician:

a. A copy of 29 CFR 1926, Section .1101 and Appendices D, E, G, and I;

b. A description of the affected employee's duties as they relate to the employee's exposure;

c. The employee's representative exposure level or anticipated exposure level;

d. A description of any personal protective and respiratory equipment used or to be used;

e. Information from previous medical examinations of the affected employee that is not otherwise available to the examining physician.

1.10.1.2 Written Medical Opinion

For each worker, a written medical opinion prepared and signed by a licensed physician indicating the following:

a. Summary of the results of the examination.

b. The potential for an existing physiological condition that would place the employee at an increased risk of health impairment from exposure to asbestos.

c. The ability of the individual to wear personal protective equipment, including respirators, while performing strenuous work tasks under cold and/or heat stress conditions.

d. A statement that the employee has been informed of the results of the examination, provided with a copy of the results, informed of the increased risk of lung cancer attributable to the combined effect of smoking and asbestos exposure, and informed of any medical condition that may result from asbestos exposure.

1.10.2 Medical and Exposure Records

Complete and accurate records shall be maintained of each employee's medical examinations, medical records, and exposure data, as required by 29 CFR 1910, Section .1910.20 and 29 CFR 1926, Section .1101 for a period of 50 years after termination of employment. Records of the required medical examinations and exposure data shall be made available, for inspection and copying, to the Assistant Secretary of Labor for Occupational Safety and Health (OSHA) or authorized representatives of the employee and an employee's physician upon request of the employee or former employee. A

copy of the required medical certification for each employee shall be maintained on file at the worksite for review, as requested by the Contracting Officer or the representatives.

## 1.11 TRAINING PROGRAM

### 1.11.1 General Training Requirements

The Contractor shall establish a training program as specified by EPA Model Accreditation Plan (MAP), training requirements at 40 CFR 763, Subpart E, Appendix C, the State of Hawaii, HAR Chapter 501, HAR Chapter 502, HAR Chapter 503, HAR Chapter 504, OSHA requirements at 29 CFR 1926, Section .1101(k)(9), and this specification. Contractor employees shall complete the required training for the type of work they are to perform and such training shall be documented and provided to the Contracting Officer as specified in paragraph QUALIFICATIONS.

### 1.11.2 Project Specific Training

Prior to commencement of work, each worker shall be instructed by the Contractor's Designated IH and Competent Person in the following project specific training:

a. The hazards and health effects of the specific types of ACM to be abated;

b. The content and requirements of the Contractor's Accident Prevention Plan to include the Asbestos Hazard Abatement Plan and Activity Hazard Analyses and site-specific safety and health precautions;

c. Hazard Communication Program;

d. Hands-on training for each asbestos abatement technique to be employed;

e. Heat stress monitoring specific to this project;

f. Air monitoring program and procedures;

g. Medical surveillance to include medical and exposure record-keeping procedures;

h. The association of cigarette smoke and asbestos-related disease;

i. Security procedures;

j. Specific work practice controls and engineering controls required for each Class of work in accordance with 29 CFR 1926, Section .1101.

## 1.12 RESPIRATORY PROTECTION PROGRAM

The Contractor's Designated IH shall establish in writing, and implement a respiratory protection program in accordance with 29 CFR 1926, Section .1101, 29 CFR 1910, Section .134, ANSI Z88.2, CGA G-7, CGA G-7.1 and DETAIL SHEET 12. The Contractor's Designated IH shall establish minimum respiratory protection requirements based on measured or anticipated levels of airborne asbestos fiber concentrations encountered during the performance of the asbestos abatement work. The Contractor's respiratory protection program

shall include, but not be limited to, the following elements:

a. The company policy, used for the assignment of individual responsibility, accountability, and implementation of the respiratory protection program.

b. The standard operating procedures covering the selection and use of respirators. Respiratory selection shall be determined by the hazard to which the worker is exposed.

c. Medical evaluation of each user to verify that the worker may be assigned to an activity where respiratory protection is required.

d. Training in the proper use and limitations of respirators.

e. Respirator fit-testing, i.e., quantitative, qualitative and individual functional fit checks.

f. Regular cleaning and disinfection of respirators.

g. Routine inspection of respirators during cleaning and after each use when designated for emergency use.

h. Storage of respirators in convenient, clean, and sanitary locations.

i. Surveillance of regulated area conditions and degree of employee exposure (e.g., through air monitoring).

j. Regular evaluation of the continued effectiveness of the respiratory protection program.

k. Recognition and procedures for the resolution of special problems as they affect respirator use (e.g., no facial hair that comes between the respirator face piece and face or interferes with valve function; prescription eye wear usage; contact lenses usage; etc.).

l. Proper training in putting on and removing respirators.

1.12.1 Respiratory Fit Testing

A qualitative or quantitative fit test conforming to 29 CFR 1926, Section 1101, Appendix C shall be conducted by the Contractor's Designated IH for each Contractor worker required to wear a respirator, and for the Contracting Officer and authorized visitors who enter a regulated area where respirators are required to be worn. A respirator fit test shall be performed for each worker wearing a negative-pressure respirator prior to initially wearing a respirator on this project and every 6 months thereafter. The qualitative fit tests may be used only for testing the fit of half-mask respirators where they are permitted to be worn, or of full-facepiece air purifying respirators where they are worn at levels at which half-facepiece air purifying respirators are permitted. If physical changes develop that will affect the fit, a new fit test for the worker shall be performed. Functional fit checks shall be performed by employees each time a respirator is put on and in accordance with the manufacturer's recommendation.

1.12.2 Respirator Selection and Use Requirements

The Contractor shall provide respirators, and ensure that they are used as required by 29 CFR 1926, Section .1101 and in accordance with the manufacturer's recommendations. Respirators shall be jointly approved by the Mine Safety and Health Administration and the National Institute for Occupational Safety and Health (MSHA/NIOSH), or by NIOSH, under the provisions of 42 CFR 84, for use in environments containing airborne asbestos fibers. Personnel who handle ACM, enter regulated areas that require the wearing of a respirator, or who are otherwise carrying out abatement activities that require the wearing of a respirator, shall be provided with approved respirators that are fully protective of the worker at the measured or anticipated airborne asbestos concentration level to be encountered. For air-purifying respirators, the particulate filter portion of the cartridges or canister approved for use in airborne asbestos environments shall be high-efficiency particulate air (HEPA). The initial respirator selection and the decisions regarding the upgrading or downgrading of respirator type shall be made by the Contractor's Designated IH based on the measured or anticipated airborne asbestos fiber concentrations to be encountered. Recommendations made by the Contractor's Designated IH to downgrade respirator type shall be submitted in writing to the Contracting Officer. The Contractor's Designated Competent Person in consultation with the Designated IH, shall have the authority to take immediate action to upgrade or downgrade respiratory type when there is an immediate danger to the health and safety of the wearer. Respirators shall be used in the following circumstances:

a. During all Class II work where the ACM is not removed in a substantially intact state.

b. During all Class II and III work which is not performed using wet methods. Respirators need not be worn during removal of ACM from sloped roofs when a negative exposure assessment has been made and ACM is removed in an intact state.

c. During all Class II and III asbestos jobs where the Contractor does not produce a negative exposure assessment.

d. In emergencies

1.12.3 Class II and III Work

The Contractor shall provide an air purifying respirator, other than a disposable respirator, equipped with high-efficiency filters whenever the employee performs Class II and III asbestos jobs where the Contractor does not produce a negative exposure assessment ; and Class III jobs where TSI or surfacing ACM is being disturbed.

1.12.4 Sanitation

Employees who wear respirators shall be permitted to leave work areas to wash their faces and respirator facepieces whenever necessary to prevent skin irritation associated with respirator use.

1.13 HAZARD COMMUNICATION PROGRAM

A hazard communication program shall be established and implemented in accordance with 29 CFR 1926, Section .59. Material safety data sheets (MSDSs) shall be provided for all hazardous materials brought onto the worksite. One copy shall be provided to the Contracting Officer and 1 copy

shall be included in the Contractor's Hazard Communication Program.

## 1.14 LICENSES, PERMITS AND NOTIFICATIONS

### 1.14.1 General Legal Requirements

Necessary licenses, permits and notifications shall be obtained in conjunction with the project's asbestos abatement, transportation and disposal actions and timely notification furnished of such actions as required by federal, state, regional, and local authorities. The Contractor shall notify the Regional Office of the USEPA state's environmental protection agency responsible for asbestos air emissions and the Contracting Officer in writing, at least 10 days prior to the commencement of work, in accordance with 40 CFR 61, Subpart M, and state and local requirements to include the mandatory "Notification of Demolition and Renovation Record" form and other required notification documents. Notification shall be by Certified Mail, Return Receipt Requested. The Contractor shall furnish copies of the receipts to the Contracting Officer, in writing, prior to the commencement of work. Local fire department shall be notified 3 days before fire-proofing material is removed from a building and the notice shall specify whether or not the material contains asbestos. A copy of the rental company's written acknowledgment and agreement shall be provided as required by paragraph RENTAL EQUIPMENT. For licenses, permits, and notifications that the Contractor is responsible for obtaining, the Contractor shall pay any associated fees or other costs incurred.

### 1.14.2 Litigation and Notification

The Contractor shall notify the Contracting Officer if any of the following occur:

a. The Contractor or any of the subcontractors are served with notice of violation of any law, regulation, permit or license which relates to this contract;

b. Proceedings are commenced which could lead to revocation of related permits or licenses; permits, licenses or other Government authorizations relating to this contract are revoked;

c. Litigation is commenced which would affect this contract;

d. The Contractor or any of the subcontractors become aware that their equipment or facilities are not in compliance or may fail to comply in the future with applicable laws or regulations.

## 1.15 PERSONAL PROTECTIVE EQUIPMENT

Three complete sets of personal protective equipment shall be made available to the Contracting Officer and authorized visitors for entry to the regulated area. Contracting Officer and authorized visitors shall be provided with training equivalent to that provided to Contractor employees in the selection, fitting, and use of the required personal protective equipment and the site safety and health requirements. Contractor workers shall be provided with personal protective clothing and equipment and the Contractor shall ensure that it is worn properly. The Contractor's Designated IH and Designated Competent Person shall select and approve all the required personal protective clothing and equipment to be used.

1.15.1 Respirators

Respirators shall be in accordance with paragraph RESPIRATORY PROTECTION PROGRAM.

1.15.2 Whole Body Protection

Personnel exposed to airborne concentrations of asbestos that exceed the PELs, or for all OSHA Classes of work for which a required negative exposure assessment is not produced, shall be provided with whole body protection and such protection shall be worn properly. The Contractor's Designated IH and Competent Person shall select and approve the whole body protection to be used. The Competent Person shall examine work suits worn by employees at least once per work shift for rips or tears that may occur during performance of work. When rips or tears are detected while an employee is working, rips and tears shall be immediately mended, or the work suit shall be immediately replaced. Disposable whole body protection shall be disposed of as asbestos contaminated waste upon exiting from the regulated area. Reusable whole body protection worn shall be either disposed of as asbestos contaminated waste upon exiting from the regulated area or be properly laundered in accordance with 29 CFR 1926, Section .1101. Whole body protection used for asbestos abatement shall not be removed from the worksite by a worker to be cleaned. Recommendations made by the Contractor's Designated IH to downgrade whole body protection shall be submitted in writing to the Contracting Officer. The Contractor's Designated Competent Person, in consultation with the Designated IH, has the authority to take immediate action to upgrade or downgrade whole body protection when there is an immediate danger to the health and safety of the wearer.

1.15.2.1 Coveralls

Disposable-breathable coveralls with a zipper front shall be provided. Sleeves shall be secured at the wrists, and foot coverings secured at the ankles. See DETAIL SHEET 13.

1.15.2.2 Work Clothing

An additional coverall shall be provided when the abatement and control method employed does not provide for the exit from the regulated area directly into an attached decontamination unit. Cloth work clothes for wear under the protective coverall, and foot coverings, shall be provided when work is being conducted in low temperature conditions.

1.15.2.3 Gloves

Gloves shall be provided to protect the hands. Where there is the potential for hand injuries (i.e., scrapes, punctures, cuts, etc.) a suitable glove shall be provided and used.

1.15.2.4 Foot Coverings

Cloth socks shall be provided and worn next to the skin. Footwear, as required by OSHA and EM 385-1-1, that is appropriate for safety and health hazards in the area shall be worn. Rubber boots shall be used in moist or wet areas. Reusable footwear removed from the regulated area shall be thoroughly decontaminated or disposed of as ACM waste. Disposable protective foot covering shall be disposed of as ACM waste. If rubber boots are not used, disposable foot covering shall be provided.

1.15.2.5 Head Covering

Hood type disposable head covering shall be provided. In addition, protective head gear (hard hats) shall be provided as required. Hard hats shall only be removed from the regulated area after being thoroughly decontaminated.

1.15.2.6 Protective Eye Wear

Eye protection provided shall be in accordance with ANSI Z87.1.

1.16 HYGIENE FACILITIES AND PRACTICES

The Contractor shall establish a decontamination area for the decontamination of employees, material and equipment. The Contractor shall ensure that employees enter and exit the regulated area through the decontamination area.

1.16.1 Shower Facilities

Shower facilities, when provided, shall comply with 29 CFR 1910, Section .141(d)(3).

1.16.2 3-Stage Decontamination Area

A temporary negative pressure decontamination unit that is adjacent and attached in a leak-tight manner to the regulated area shall be provided as described in SET-UP DETAIL SHEET Numbers 22 and 23. The decontamination unit shall have an equipment room and a clean room separated by a shower that complies with 29 CFR 1910, Section .141 (unless the Contractor can demonstrate that such facilities are not feasible). Equipment and surfaces of containers filled with ACM shall be cleaned prior to removing them from the equipment room or area. Surfaces of the equipment room shall be wet wiped 2 times after each shift. Materials used for wet wiping shall be disposed of as asbestos contaminated waste. Two separate lockers shall be provided for each asbestos worker, one in the equipment room and one in the clean room. Hot water service may be secured from the building hot water system provided backflow protection is installed by the Contractor at the point of connection. The wastewater pump shall be sized for 1.25 times the showerhead flow-rate at a pressure head sufficient to satisfy the filter head loss and discharge line losses. The pump shall supply a minimum 25 gpm flow with 35 ft. of pressure head. Used shower water shall be collected and filtered to remove asbestos contamination. Filters and residue shall be disposed of as asbestos contaminated material, per DETAIL SHEETS 9 and 14. Filtered water shall be discharged to the sanitary system. Wastewater filters shall be installed in series with the first stage pore size of 20 microns and the second stage pore size of 5 microns. The floor of the decontamination unit's clean room shall be kept dry and clean at all times. Water from the shower shall not be allowed to wet the floor in the clean room. Surfaces of the clean room and shower shall be wet-wiped 2 times after each shift change with a disinfectant solution. Proper housekeeping and hygiene requirements shall be maintained. Soap and towels shall be provided for showering, washing and drying. Any cloth towels provided shall be disposed of as ACM waste or shall be laundered in accordance with 29 CFR 1926, Section .1101.

1.16.3 Decontamination Area Entry Procedures

The Contractor shall ensure that employees entering the decontamination

area through the clean room or clean area:

a. Remove street clothing in the clean room or clean area and deposit it in lockers.

b. Put on protective clothing and respiratory protection before leaving the clean room or clean area.

c. Pass through the equipment room to enter the regulated area.

1.16.4 Decontamination Area Exit Procedures

The Contractor shall ensure that the following procedures are followed:

a. Before leaving the regulated area, respirators shall be worn while employees remove all gross contamination and debris from their work clothing using a HEPA vacuum.

b. Employees shall remove their protective clothing in the equipment room and deposit the clothing in labeled impermeable bags or containers (see Detail Sheets 9 and 14) for disposal and/or laundering.

c. Employees shall not remove their respirators in the equipment room.

d. Employees shall shower prior to entering the clean room. If a shower has not been located between the equipment room and the clean room or the work is performed outdoors, the Contractor shall ensure that employees engaged in Class I asbestos jobs: a) Remove asbestos contamination from their work suits in the equipment room or decontamination area using a HEPA vacuum before proceeding to a shower that is not adjacent to the work area; or b) Remove their contaminated work suits in the equipment room, without cleaning worksuits, and proceed to a shower that is not adjacent to the work area.

e. After showering, employees shall enter the clean room before changing into street clothes.

1.16.5 Lunch Areas

The Contractor shall provide lunch areas in which the airborne concentrations of asbestos are below 0.01 f/cc.

1.16.6 Smoking

Smoking, if allowed by the Contractor, shall only be permitted in designated areas approved by the Contracting Officer.

1.17 REGULATED AREAS

All Class I, II, and III asbestos work shall be conducted within regulated areas. The regulated area shall be demarcated to minimize the number of persons within the area and to protect persons outside the area from exposure to airborne asbestos. Where critical barriers or negative pressure enclosures are used, they shall demarcate the regulated area. Access to regulated areas shall be limited to authorized persons. The Contractor shall control access to regulated areas, ensure that only authorized personnel enter, and verify that Contractor required medical

surveillance, training and respiratory protection program requirements are met prior to allowing entrance.

1.18 WARNING SIGNS AND TAPE

Warning signs and tape printed in English shall be provided at the regulated boundaries and entrances to regulated areas. The Contractor shall ensure that all personnel working in areas contiguous to regulated areas comprehend the warning signs. Signs shall be located to allow personnel to read the signs and take the necessary protective steps required before entering the area. Warning signs, as shown and described in DETAIL SHEET 11, shall be in vertical format conforming to 29 CFR 1910 and 29 CFR 1926, Section .1101, a minimum of 20 by 14 inches, and displaying the following legend in the lower panel:

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED IN THIS AREA

Spacing between lines shall be at least equal to the height of the upper of any two lines. Warning tape shall be provided as shown and described on DETAIL SHEET 11. Decontamination unit signage shall be as shown and described on DETAIL SHEET 15.

1.19 WARNING LABELS

Warning labels shall be affixed to all asbestos disposal containers used to contain asbestos materials, scrap, waste debris, and other products contaminated with asbestos. Containers with preprinted warning labels conforming to requirements are acceptable. Warning labels shall be as described in DETAIL SHEET 14, shall conform to 29 CFR 1926, Section .1101 and shall be of sufficient size to be clearly legible displaying the following legend:

DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD

1.20 LOCAL EXHAUST VENTILATION

Local exhaust ventilation units shall conform to ANSI Z9.2 and 29 CFR 1926, Section .1101. Filters on local exhaust system equipment shall conform to ANSI Z9.2 and UL 586. Filter shall be UL labeled.

1.21 TOOLS

Vacuums shall be leak proof to the filter, equipped with HEPA filters, of sufficient capacity and necessary capture velocity at the nozzle or nozzle attachment to efficiently collect, transport and retain the ACM waste material. Power tools shall not be used to remove ACM unless the tool is equipped with effective, integral HEPA filtered exhaust ventilation capture and collection system, or has otherwise been approved for use by the Contracting Officer. Residual asbestos shall be removed from reusable tools prior to storage and reuse. Reusable tools shall be thoroughly decontaminated prior to being removed from regulated areas.

## 1.22 RENTAL EQUIPMENT

If rental equipment is to be used, written notification shall be provided to the rental agency, concerning the intended use of the equipment, the possibility of asbestos contamination of the equipment and the steps that will be taken to decontaminate such equipment. A written acceptance of the terms of the Contractor's notification shall be obtained from the rental agency.

## 1.23 AIR MONITORING EQUIPMENT

The Contractor's Designated IH shall approve air monitoring equipment to be used to collect samples. The equipment shall include, but shall not be limited to:

a. High-volume sampling pumps that can be calibrated and operated at a constant airflow up to 16 liters per minute when equipped with a sampling train of tubing and filter cassette.

b. Low-volume, battery powered, body-attachable, portable personal pumps that can be calibrated to a constant airflow up to approximately 3.5 liters per minute when equipped with a sampling train of tubing and filter cassette, and a self-contained rechargeable power pack capable of sustaining the calibrated flow rate for a minimum of 10 hours. The pumps shall also be equipped with an automatic flow control unit which shall maintain a constant flow, even as filter resistance increases due to accumulation of fiber and debris on the filter surface.

c. Single use standard 25 mm diameter cassette, open face, 0.8 micron pore size, mixed cellulose ester membrane filters and cassettes with 50 mm electrically conductive extension cowl, and shrink bands, to be used with low flow pumps in accordance with 29 CFR 1926, Section .1101 for personal air sampling.

d. Single use standard 25 mm diameter cassette, open face, 0.45 micron pore size, mixed cellulose ester membrane filters and cassettes with 50 mm electrically conductive cowl, and shrink bands, to be used with high flow pumps when conducting environmental area sampling using NIOSH Pub No. 84-100 Methods 7400 and 7402, (and the transmission electric microscopy method specified at 40 CFR 763 if required).

e. Appropriate plastic tubing to connect the air sampling pump to the selected filter cassette.

f. A flow calibrator capable of calibration to within plus or minus 2 percent of reading over a temperature range of minus 4 to plus 140 degrees F and traceable to a NIST primary standard.

## 1.24 EXPENDABLE SUPPLIES

### 1.24.1 Glovebag

Glovebags shall be provided as described in 29 CFR 1926, Section .1101 and SET-UP DETAIL SHEET 10. The glovebag assembly shall be 6 mil thick plastic, prefabricated and seamless at the bottom with preprinted OSHA warning label.

1.24.2 Duct Tape

Industrial grade duct tape of appropriate widths suitable for bonding sheet plastic and disposal container shall be provided.

1.24.3 Disposal Containers

Leak-tight (defined as solids, liquids, or dust that cannot escape or spill out) disposal containers shall be provided for ACM wastes as required by 29 CFR 1926 Section .1101 and DETAIL SHEETS 9A, 9B, 9C and 14.

1.24.4 Disposal Bags

Leak-tight bags, 6 mil thick, shall be provided for placement of asbestos generated waste as described in DETAIL SHEET 9A.

1.24.5 Sheet Plastic

Sheet plastic shall be polyethylene of 6 mil minimum thickness and shall be provided in the largest sheet size necessary to minimize seams ,as indicated on the project drawings. Film shall be clear and conform to ASTM D 4397, except as specified below:

1.24.6 Amended Water

Amended water shall meet the requirements of ASTM D 1331.

1.24.7 Mastic Removing Solvent

Mastic removing solvent shall be nonflammable and shall not contain methylene chloride, glycol ether, or halogenated hydrocarbons. Solvents used onsite shall have a flash point greater than 140 degrees F.

1.24.8 Leak-tight Wrapping

Two layers of 6 mil minimum thick polyethylene sheet stock shall be used for the containment of removed asbestos-containing components or materials such as reactor vessels, large tanks, boilers, insulated pipe segments and other materials too large to be placed in disposal bags as described in DETAIL SHEET 9B. Upon placement of the ACM component or material, each layer shall be individually leak-tight sealed with duct tape.

1.24.9 Wetting Agents

Removal encapsulant (a penetrating encapsulant) shall be provided when conducting removal abatement activities that require a longer removal time or are subject to rapid evaporation of amended water. The removal encapsulant shall be capable of wetting the ACM and retarding fiber release during disturbance of the ACM greater than or equal to that provided by amended water. Performance requirements for penetrating encapsulants are specified in paragraph ENCAPSULANTS.

1.24.10 Strippable Coating

Strippable coating in aerosol cans shall be used to adhere to surfaces and to be removed cleanly by stripping, at the completion of work. This work shall only be done in well ventilated areas.

1.25 MISCELLANEOUS ITEMS

A sufficient quantity of other items, such as, but not limited to: scrapers, brushes, brooms, staple guns, tarpaulins, shovels, rubber squeegees, dust pans, other tools, scaffolding, staging, enclosed chutes, wooden ladders, lumber necessary for the construction of containments, UL approved temporary electrical equipment, material and cords, ground fault circuit interrupters, water hoses of sufficient length, fire extinguishers, first aid kits, portable toilets, logbooks, log forms, markers with indelible ink, spray paint in bright color to mark areas, project boundary fencing, etc., shall be provided.

## PART 2 PRODUCTS

### 2.1 ENCAPSULANTS

Encapsulants shall conform to USEPA requirements, shall contain no toxic or hazardous substances and no solvent and shall meet the following requirements:

ALL ENCAPSULANTS

| Requirement | Test Standard |
|---|---|
| Flame Spread - 25, Smoke Emission - 50 | ASTM E 84 |
| Combustion Toxicity Zero Mortality | Univ. of Pittsburgh Protocol |
| Life Expectancy, 20 yrs Accelerated Aging Test | ASTM C 732 |
| Permeability, Minimum 0.4 perms | ASTM E 96 |

## PART 3 EXECUTION

### 3.1 GENERAL REQUIREMENTS

Asbestos abatement work tasks shall be performed as shown on the detailed plans and drawings, as summarized in paragraph DESCRIPTION OF WORK and including Table 1 and the Contractor's Accident Prevention Plan, Asbestos Hazard Abatement Plan, and the Activity Hazard Analyses. The Contractor shall use the engineering controls and work practices required in 29 CFR 1926, Section .1101(g) in all operations regardless of the levels of exposure. Personnel shall wear and utilize protective clothing and equipment as specified. The Contractor shall not permit eating, smoking, drinking, chewing or applying cosmetics in the regulated area. All hot work (burning, cutting, welding, etc.) shall be conducted under controlled conditions in conformance with 29 CFR 1926, Section .352, Fire Prevention. Personnel of other trades, not engaged in asbestos abatement activities, shall not be exposed at any time to airborne concentrations of asbestos unless all the administrative and personal protective provisions of the Contractor's Accident Prevention Plan are complied with. Power to the regulated area shall be locked-out and tagged in accordance with 29 CFR 1910, and temporary electrical service with ground fault circuit interrupters shall be provided as needed. Temporary electrical service shall be disconnected when necessary for wet removal. The Contractor shall stop abatement work in the regulated area immediately when the airborne total fiber concentration: (1) equals or exceeds 0.01 f/cc, or the pre-abatement concentration, whichever is greater, outside the regulated area; or (2)

equals or exceeds 1.0 f/cc inside the regulated area. The Contractor shall correct the condition to the satisfaction of the Contracting Officer, including visual inspection and air sampling. Work shall resume only upon notification by the Contracting Officer. Corrective actions shall be documented.

## 3.2 PROTECTION OF ADJACENT WORK OR AREAS TO REMAIN

Asbestos abatement shall be performed without damage to or contamination of adjacent work or area. Where such work or area is damaged or contaminated, as verified by the Contracting Officer using visual inspection or sample analysis, it shall be restored to its original condition or decontaminated by the Contractor at no expense to the Government, as deemed appropriate by the Contracting Officer. This includes inadvertent spill of dirt, dust or debris in which it is reasonable to conclude that asbestos may exist. When these spills occur, work shall stop in all effected areas immediately and the spill shall be cleaned. When satisfactory visual inspection and air sampling analysis results are obtained and have been evaluated by the Contractor's Designated IH and the Contracting Officer, work shall proceed.

## 3.3 PRECLEANING

Surfaces shall be cleaned by HEPA vacuum and adequately wet wiped prior to establishment of containment.

## 3.4 METHODS OF COMPLIANCE

### 3.4.1 Mandated Practices

The Contractor shall employ proper handling procedures in accordance with 29 CFR 1926 and 40 CFR 61, Subpart M, and the specified requirements. The specific abatement techniques and items identified shall be detailed in the Contractor's Asbestos Hazard Abatement Plan including, but not limited to, details of construction materials, equipment, and handling procedures. The Contractor shall use the following engineering controls and work practices in all operations, regardless of the levels of exposure:

a. Vacuum cleaners equipped with HEPA filters to collect debris and dust containing ACM.

b. Wet methods or wetting agents to control employee exposures during asbestos handling, mixing, removal, cutting, application, and cleanup; except where it can be demonstrated that the use of wet methods is unfeasible due to, for example, the creation of electrical hazards, equipment malfunction, and in roofing.

c. Prompt clean-up and disposalin leak-tight containers of wastes and debris contaminated with asbestos.

d. Inspection and repair of polyethylene in work and high traffic areas.

e. Cleaning of equipment and surfaces of containers filled with ACM prior to removing them from the equipment room or area.

### 3.4.2 Control Methods

The Contractor shall use the following control methods to comply with the PELs:

a. Local exhaust ventilation equipped with HEPA filter dust collection systems;

b. Enclosure or isolation of processes producing asbestos dust;

c. Ventilation of the regulated area to move contaminated air away from the breathing zone of employees and toward a filtration or collection device equipped with a HEPA filter;

d. Use of other work practices and engineering controls;

e. Where the feasible engineering and work practice controls described above are not sufficient to reduce employee exposure to or below the PELs, the Contractor shall use them to reduce employee exposure to the lowest levels attainable by these controls and shall supplement them by the use of respiratory protection that complies with paragraph, RESPIRATORY PROTECTION PROGRAM.

3.4.3 Unacceptable Practices

The following work practices and engineering controls shall not be used for work related to asbestos or for work which disturbs ACM, regardless of measured levels of asbestos exposure or the results of initial exposure assessments:

a. High-speed abrasive disc saws that are not equipped with point of cut ventilator or enclosures with HEPA filtered exhaust air.

b. Compressed air used to remove asbestos, or materials containing asbestos, unless the compressed air is used in conjunction with an enclosed ventilation system designed to capture the dust cloud created by the compressed air.

c. Dry sweeping, shoveling, or other dry clean-up of dust and debris containing ACM.

d. Employee rotation as a means of reducing employee exposure to asbestos.

3.4.4 Negative Pressure Enclosure (NPE) System

The NPE system shall be as shown in SETUP DETAIL SHEET 4. The system shall provide at least 4 air changes per hour inside the containment. The local exhaust unit equipment shall be operated 24 hours per day until the containment is removed, and shall be leak-proof to the filter and equipped with HEPA filters. Air movement shall be directed away from the employees and toward a HEPA filtration device. The NPE shall be smoke tested for leaks at the beginning of each shift. Local exhaust equipment shall be sufficient to maintain a minimum pressure differential of minus 0.02 inch of water column relative to adjacent, unsealed areas. Pressure differential shall be monitored continuously, 24 hours per day, with an automatic manometric recording instrument. Pressure differential recordings shall be provided daily on the same day collected. Readings shall be reviewed by the Contractor's Designated Competent Person and IH prior to submittal. The Contracting Officer shall be notified immediately if the pressure differential falls below the prescribed minimum. The building ventilation system shall not be used as the local exhaust system

for the regulated area. The local exhaust system shall terminate outdoors unless an alternate arrangement is allowed by the Contract Officer. All filters used shall be new at the beginning of the project and shall be periodically changed as necessary and disposed of as ACM waste.

3.4.5 Class II Work

In addition to the requirements of paragraphs Mandated Practices and Control Methods, the following engineering controls and work practices shall be used:

a. A Competent Person shall supervise the work.

b. For indoor work, critical barriers shall be placed over all openings to the regulated area.

c. Impermeable dropcloths shall be placed on surfaces beneath all removal activity.

3.4.6 Specific Control Methods for Class II Work

In addition to requirements of paragraph Class II Work, Class II work shall be performed using the following methods:

3.4.6.1 Vinyl and Asphalt Flooring Materials

When removing vinyl and asphalt flooring materials which contain ACM, the Contractor shall use the following practices as shown in RESPONSE ACTION DETAIL SHEET 57. Resilient sheeting shall be removed by adequately wet methods. Tiles shall be removed intact (if possible); wetting is not required when tiles are heated and removed intact. Flooring or its backing shall not be sanded. Scraping of residual adhesive and/or backing shall be performed using wet methods. Mechanical chipping is prohibited unless performed in a negative pressure enclosure. Dry sweeping is prohibited. The Contractor shall use vacuums equipped with HEPA filter, disposable dust bag, and metal floor tool (no brush) to clean floors.

3.4.6.2 Roofing Material

Survey Contractor was able to sample the roof. It should be sampled if it is planned to be disturbed. The specification assumes that the sealant around vent pipes are ACM, due to results of other surveys completed on other Quad Buildings.

When removing roofing materials which contain ACM as described in 29 CFR 1926, Section .1101(g)(8)(ii), the Contractor shall use the following practices as shown in RESPONSE ACTION DETAIL SHEET 75. Roofing material shall be removed in an intact state. Wet methods shall be used to remove roofing materials that are not intact, or that will be rendered not intact during removal, unless such wet methods are not feasible or will create safety hazards. When removing built-up roofs, with asbestos-containing roofing felts and an aggregate surface, using a power roof cutter, all dust resulting from the cutting operations shall be collected by a HEPA dust collector, or shall be HEPA vacuumed by vacuuming along the cut line. Asbestos-containing roofing material shall not be dropped or thrown to the ground, but shall be lowered to the ground via covered, dust-tight chute, crane, hoist or other method approved by the Contracting Officer. Any ACM that is not intact shall be lowered to the ground as soon as practicable, but not later than the end of the work shift. While the material remains

on the roof it shall be kept wet or placed in an impermeable waste bag or wrapped in plastic sheeting. Intact ACM shall be lowered to the ground as soon as practicable, but not later than the end of the work shift. Unwrapped material shall be transferred to a closed receptacle precluding the dispersion of dust. Critical barriers shall be placed over roof level heating and ventilation air intakes.

3.4.6.3 Caulking

The caulking around the exhaust fan outside of the kitchen (Dining Facility) contains asbestos. The material shall be wetted prior to scraping. All removed material shall be double bagged.

3.4.6.4 Other Class II Jobs

The Contractor shall use the following work practices when performing Class II removal of non friable ACM: The material shall be thoroughly wetted with amended water prior and during its removal. The material shall be removed in an intact state. Cutting, abrading or breaking the material is prohibited. The ACM removed shall be immediately bagged or wrapped.

3.4.7 Alternative Methods for Roofing Materials and Asphaltic Wrap

The Contractor shall use the following engineering controls and work practices when removing, repairing, or maintaining intact pipeline asphaltic wrap, or roof cements, mastics, coatings, or flashings which contain asbestos fibers encapsulated or coated by bituminous or resinous compounds. If during the course of the job the material does not remain intact, the Contractor shall use the procedures described in paragraph Roofing Material. Before work begins, and as needed during the job, the Designated Competent Person shall conduct an inspection and determine that the roofing material is intact and will likely remain intact. The material shall not be sanded, abraded, or ground. Manual methods which would render the material non-intact shall not be used. Roofing material shall not be dropped or thrown to the ground but shall be lowered via covered, dust-tight chute, crane, hoist or other method approved by the Contracting Officer. All such material shall be removed from the roof as soon as practicable, but not later than the end of the work shift. Removal or disturbance of pipeline asphaltic wrap shall be performed using wet methods.

3.4.8 Cleaning After Asbestos Removal

After completion of all asbestos removal work, surfaces from which ACM has been removed shall be wet wiped or sponged clean, or cleaned by some equivalent method to remove all visible residue. Run-off water shall be collected and filtered through a dual filtration system. A first filter shall be provided to remove fibers 20 micrometers and larger, and a final filter provided that removes fibers 5 micrometers and larger. After the gross amounts of asbestos have been removed from every surface, remaining visible accumulations of asbestos on floors shall be collected using plastic shovels, rubber squeegees, rubber dustpans, and HEPA vacuum cleaners as appropriate to maintain the integrity of the regulated area.

3.4.9 Class II Asbestos Work Response Action Detail Sheets

The following Class II Asbestos Work Response Action Detail Sheet is specified on Table 1 for each individual work task to be performed:

a. Vinyl Asbestos Tile Adhered to Concrete Floor System by Asbestos

Containing Adhesive: See Sheet 57

## 3.5 FINAL CLEANING AND VISUAL INSPECTION

Upon completion of abatement, the regulated area shall be cleaned by collecting, packing, and storing all gross contamination; see SET-UP DETAIL SHEETS 9 and 14. A final cleaning shall be performed using HEPA vacuum and wet cleaning of all exposed surfaces and objects in the regulated area.Upon completion of the cleaning, the Contractor shall conduct a visual pre-inspection of the cleaned area in preparation for a final inspection before final air clearance monitoring and recleaning, as necessary. Upon completion of the final cleaning, the Contractor and the Contracting Officer shall conduct a final visual inspection of the cleaned regulated area in accordance with ASTM E 1368 and document the results on the Final Cleaning and Visual Inspection as specified on the SET-UP DETAIL SHEET 19. If the Contracting Officer rejects the clean regulated area as not meeting final cleaning requirements, the Contractor shall reclean as necessary and have a follow-on inspection conducted with the Contracting Officer. Recleaning and follow-up reinspection shall be at the Contractor's expense.

## 3.6 LOCKDOWN

Prior to removal of plastic barriers and after clean-up of gross contamination and final visual inspection, a post removal (lockdown) encapsulant shall be spray applied to ceiling, walls, floors, and other surfaces in the regulated area.

## 3.7 EXPOSURE ASSESSMENT AND AIR MONITORING

### 3.7.1 General Requirements For Exposure

Exposure assessment, air monitoring and analysis of airborne concentration of asbestos fibers shall be performed in accordance with 29 CFR 1926, Section .1101, the Contractor's air monitoring plan, and as specified. Personal exposure air monitoring (collected at the breathing zone) that is representative of the exposure of each employee who is assigned to work within a regulated area shall be performed by the Contractor's Designated IH. Breathing zone samples shall be taken for at least 25 percent of the workers in each shift, or a minimum of 2, whichever is greater. Air monitoring results at the 95 percent confidence level shall be calculated as shown in Table 2 at the end of this section. The Contractor shall provide an onsite independent testing laboratory with qualified analysts and appropriate equipment to conduct sample analyses of air samples using the methods prescribed in 29 CFR 1926, Section .1101, to include NIOSH Pub No. 84-100 Method 7400. Preabatement and abatement environmental air monitoring shall be performed by the Contractor's Designated IH. Final clearance environmental air monitoring, shall be performed by the Contractor's Designated IH. Environmental and final clearance air monitoring shall be performed using NIOSH Pub No. 84-100 Method 7400 (PCM). For environmental and final clearance, air monitoring shall be conducted at a sufficient velocity and duration to establish the limit of detection of the method used at 0.005 f/cc. When such confirmation is conducted, it shall be from the same sample filter used for the NIOSH Pub No. 84-100 Method 7400 PCM analysis. For all Contractor required environmental or final clearance air monitoring, confirmation of asbestos fiber concentrations, using NIOSH Pub No. 84-100 Method 7402, shall be at the Contractor's expense. Monitoring may be duplicated by the Government at the discretion of the Contracting Officer. Results of breathing zone samples shall be posted at the job site and made available to the

Contracting Officer. The Contractor shall maintain a fiber concentration inside a regulated area less than or equal to 0.1 f/cc expressed as an 8 hour, time-weighted average (TWA) during the conduct of the asbestos abatement. If fiber concentration rises above 0.1 f/cc, work procedures shall be investigated with the Contracting Officer to determine the cause. At the discretion of the Contracting Officer, fiber concentration may exceed 0.1 f/cc but shall not exceed 1.0 f/cc expressed as an 8-hour TWA. The Contractor's workers shall not be exposed to an airborne fiber concentration in excess of 1.0 f/cc, as averaged over a sampling period of 30 minutes. Should either an environmental concentration of 1.0 f/cc expressed as an 8-hour TWA or a personal excursion concentration of 1.0 f/cc expressed as a 30-minute sample occur inside a regulated work area, the Contractor shall stop work immediately, notify the Contracting Officer, and implement additional engineering controls and work practice controls to reduce airborne fiber levels below prescribed limits in the work area. Work shall not restart until authorized by the Contracting Officer.

3.7.2 Initial Exposure Assessment

The Contractor's Designated IH shall conduct an exposure assessment immediately before or at the initiation of an asbestos abatement operation to ascertain expected exposures during that operation. The assessment shall be completed in time to comply with the requirements which are triggered by exposure data or the lack of a negative exposure assessment, and to provide information necessary to assure that all control systems planned are appropriate for that operation. The assessment shall take into consideration both the monitoring results and all observations, information or calculations which indicate employee exposure to asbestos, including any previous monitoring conducted in the workplace, or of the operations of the Contractor which indicate the levels of airborne asbestos likely to be encountered on the job.

3.7.3 Negative Exposure Assessment

The Contractor shall provide a negative exposure assessment for the specific asbestos job which will be performed. The negative exposure assessment shall be provided within 5 days of the initiation of the project and conform to the following criteria:

a. Objective Data: Objective data demonstrating that the product or material containing asbestos minerals or the activity involving such product or material cannot release airborne fibers in concentrations exceeding the PEL-TWA and PEL-Excursion Limit under those work conditions having the greatest potential for releasing asbestos.

b. Prior Asbestos Jobs: Where the Contractor has monitored prior asbestos jobs for the PEL and the PEL-Excursion Limit within 12 months of the current job, the monitoring and analysis were performed in compliance with asbestos standard in effect; the data were obtained during work operations conducted under workplace conditions closely resembling the processes, type of material, control methods, work practices, and environmental conditions used and prevailing in the Contractor's current operations; the operations were conducted by employees whose training and experience are no more extensive than that of employees performing the current job; and these data show that under the conditions prevailing and which will prevail in the current workplace, there is a high degree of certainty that the monitoring covered exposure

from employee exposures will not exceed the PEL-TWA and PEL-Excursion Limit.

c. Initial Exposure Monitoring: The results of initial exposure monitoring of the current job, made from breathing zone air samples that are representative of the 8-hour PEL-TWA and 30-minute short-term exposures of each employee. The monitoring covered exposure from operations which are most likely during the performance of the entire asbestos job to result in exposures over the PELs.

3.7.4 Preabatement Environmental Air Monitoring

Preabatement environmental air monitoring shall be established 1 day prior to the masking and sealing operations for each regulated area to determine background concentrations before abatement work begins. As a minimum, preabatement air samples shall be collected using NIOSH Pub No. 84-100 Method 7400, PCM at these locations: outside the building; inside the building, but outside the regulated area perimeter; and inside each regulated work area. One sample shall be collected for every 2000 square feet of floor space. At least 2 samples shall be collected outside the building: at the exhaust of the HEPA unit; and downwind from the abatement site. The PCM samples shall be analyzed within 24 hours; and if any result in fiber concentration greater than 0.01 f/cc. Area shall be resampled.

3.7.5 Environmental Air Monitoring During Abatement

Until an exposure assessment is provided to the Contracting Officer, environmental air monitoring shall be conducted at locations and frequencies that will accurately characterize any evolving airborne asbestos fiber concentrations. The assessment shall demonstrate that the product or material containing asbestos minerals, or the abatement involving such product or material, cannot release airborne asbestos fibers in concentrations exceeding 0.01 f/cc as a TWA under those work conditions having the greatest potential for releasing asbestos. The monitoring shall be at least once per shift at locations including, but not limited to, close to the work inside a regulated area; preabatement sampling locations; outside entrances to a regulated area; close to glovebag operations; representative locations outside of the perimeter of a regulated area; inside clean room; and at the exhaust discharge point of local exhaust system ducted to the outside of a containment (if used). If the sampling outside regulated area shows airborne fiber levels have exceeded background or 0.01 f/cc, whichever is greater, work shall be stopped immediately, and the Contracting Officer notified. The condition causing the increase shall be corrected. Work shall not restart until authorized by the Contracting Officer.

3.7.6 Final Clearance Air Monitoring

Prior to conducting final clearance air monitoring, the Contractor and the Contracting Officer shall conduct a final visual inspection of the regulated area where asbestos abatement has been completed. The final visual inspection shall be as specified in SET-UP DETAIL SHEET 19. Final clearance air monitoring shall not begin until acceptance of the Contractor's final cleaning by the Contracting Officer. The Contractor's Designated IH shall conduct final clearance air monitoring using aggressive air sampling techniques as defined in EPA 560/5-85-024 or as otherwise required by federal or state requirements. The sampling and analytical method used will be NIOSH Pub No. 84-100 Method 7400 (PCM).

3.7.6.1 Final Clearance Requirements, NIOSH PCM Method

For PCM sampling and analysis using NIOSH Pub No. 84-100 Method 7400, the fiber concentration inside the abated regulated area, for each airborne sample, shall be less than 0.01 f/cc. The abatement inside the regulated area is considered complete when every PCM final clearance sample is below the clearance limit. If any sample result is greater than 0.01 total f/cc, the asbestos fiber concentration (asbestos f/cc) shall be confirmed from that same filter using NIOSH Pub No. 84-100 Method 7402 (TEM) at Contractor's expense. If any confirmation sample result is greater than 0.01 asbestos f/cc, abatement is incomplete and cleaning shall be repeated. Upon completion of any required recleaning, resampling with results to meet the above clearance criteria shall be done.

3.7.6.2 Air Clearance Failure

If clearance sampling results fail to meet the final clearance requirements, the Contractor shall pay all costs associated with the required recleaning, resampling, and analysis, until final clearance requirements are met.

3.7.7 Air-Monitoring Results and Documentation

Air sample fiber counting shall be completed and results provided within 24 hours (breathing zone samples), and 24 hours (environmental/clearance monitoring) after completion of a sampling period. The Contracting Officer shall be notified immediately of any airborne levels of asbestos fibers in excess of established requirements. Written sampling results shall be provided within 5 working days of the date of collection. The written results shall be signed by testing laboratory analyst, testing laboratory principal and the Contractor's Designated IH. The air sampling results shall be documented on a Contractor's daily air monitoring log. The daily air monitoring log shall contain the following information for each sample:

a. Sampling and analytical method used;

b. Date sample collected;

c. Sample number;

d. Sample type: BZ = Breathing Zone (Personal), P = Preabatement, E = Environmental, C = Abatement Clearance;

e. Location/activity/name where sample collected;

f. Sampling pump manufacturer, model and serial number, beginning flow rate, end flow rate, average flow rate (L/min);

g. Calibration date, time, method, location, name of calibrator, signature;

h. Sample period (start time, stop time, elapsed time (minutes);

i. Total air volume sampled (liters);

j. Sample results (f/cc and S/mm square) if EPA methods are required for final clearance;

k. Laboratory name, location, analytical method, analyst, confidence level. In addition, the printed name and a signature and date block for the Industrial Hygienist who conducted the sampling and for the Industrial Hygienist who reviewed the daily air monitoring log verifying the accuracy of the information.

## 3.8 CLEARANCE CERTIFICATION

When asbestos abatement is complete, ACM waste is removed from the regulated areas, and final clean-up is completed, the Contracting Officer will certify the areas as safe before allowing the warning signs and boundary warning tape to be removed. After final clean-up and acceptable airborne concentrations are attained, but before the HEPA unit is turned off and the containment removed, the Contractor shall remove all pre-filters on the building HVAC system and provide new pre-filters. The Contractor shall dispose of such filters as asbestos contaminated materials. HVAC, mechanical, and electrical systems shall be re-established in proper working order. The Contractor and the Contracting Officer shall visually inspect all surfaces within the containment for residual material or accumulated debris. The Contractor shall reclean all areas showing dust or residual materials. The Contracting Officer will certify in writing that the area is safe before unrestricted entry is permitted. The Government will have the option to perform monitoring to certify the areas are safe before entry is permitted.

## 3.9 CLEANUP AND DISPOSAL

### 3.9.1 Title to ACM Materials

ACM material resulting from abatement work, except as specified otherwise, shall become the property of the Contractor and shall be disposed of as specified and in accordance with applicable federal, state and local regulations.

### 3.9.2 Collection and Disposal of Asbestos

All ACM waste shall be collected and including contaminated wastewater filters, scrap, debris, bags, containers, equipment, and asbestos contaminated clothing, shall be collected and placed in leak-tight containers such as double plastic bags (see DETAIL SHEET 9A). Waste within the containers shall be wetted in case the container is breeched. Asbestos-containing waste shall be disposed of at an EPA, state and local approved asbestos landfill. For temporary storage, sealed impermeable containers shall be stored in an asbestos waste load-out unit or in a storage/transportation conveyance (i.e., dumpster, roll-off waste boxes, etc.) in a manner acceptable to and in an area assigned by the Contracting Officer. Procedure for hauling and disposal shall comply with 40 CFR 61, Subpart M, state, regional, and local standards.

### 3.9.3 Scale Weight Measurement

Scales used for measurement shall be public scales. Weighing shall be at a point nearest the work at which a public scale is available. Scales shall be standard truck scales of the beam type; scales shall be equipped with the type registering beam and an "over and under" indicator; and shall be capable of accommodating the entire vehicle. Scales shall be tested, approved and sealed by an inspector of the State of Hawaii. Scales shall be calibrated and resealed as often as necessary and at least once every three months to ensure continuous accuracy. Vehicles used for hauling ACM

shall be weighed empty daily at such time as directed and each vehicle shall bear a plainly legible identification mark.

3.9.4 Weigh Bill and Delivery Tickets

Copies of weigh bills and delivery tickets shall be submitted to the Contracting Officer during the progress of the work. The Contractor shall furnish the Contracting Officer scale tickets for each load of ACM weighed and certified. These tickets shall include tare weight; identification mark for each vehicle weighed; and date, time and location of loading and unloading. Tickets shall be furnished at the point and time individual trucks arrive at the worksite. A master log of all vehicle loading shall be furnished for each day of loading operations. Before the final statement is allowed, the Contractor shall file with the Contracting Officer certified weigh bills and/or certified tickets and manifests of all ACM actually disposed by the Contractor for this contract.

3.9.5 Asbestos Waste Shipment Record

The Contractor shall complete and provide the Contracting Officer final completed copies of the Waste Shipment Record for all shipments of waste material as specified in 40 CFR 61, Subpart M and other required state waste manifest shipment records, within 3 days of delivery to the landfill. Each Waste Shipment Record shall be signed and dated by the Contractor, the waste transporter and disposal facility operator.

TABLE 1

INDIVIDUAL WORK TASK DATA ELEMENTS

Sheet 1 of 1

There is a separate data sheet for each individual work task.

1. WORK TASK DESIGNATION NUMBER: 01_____
2. LOCATION OF WORK TASK: Quad C Schofield Barrracks (Bldg 355, 356, 357 and 358 _____
3. BRIEF DESCRIPTION OF MATERIAL TO BE ABATED: Asbestos floor tile, mastic and caulking_____

   a. Type of Asbestos: Chrysotile _____
   b. Percent asbestos content: 5%_____

4. ABATEMENT TECHNIQUE TO BE USED: wet method_____
5. OSHA ASBESTOS CLASS DESIGNATION FOR WORK TASK: Class II_____
6. EPA NESHAP FRIABILITY DESIGNATION FOR WORK TASK
   Friable _____ Non-friable Category I __x___
   Non-friable Category II_____
7. FORM _____ and CONDITION OF ACM: GOOD_____ FAIR_____ POOR_____
8. QUANTITY: METERS_____, SQUARE METERS_____
8a. QUANTITY: LINEAR FT._____, SQUARE FT._____
9. RESPONSE ACTION DETAIL SHEET NUMBER FOR WORK TASK_____
10. SET-UP DETAIL SHEET NUMBERS
    FOR WORK TASK 4, 9A, 11, 12, 13, 14, 15, 19, 22, 23, 45, 57.

NOTES:

(1) Numeric sequence of individual work tasks (1,2,3,4, etc.) for each regulated area. Each category of EPA friability/OSHA class has a separate task.
(2) Specific location of work (building, floor, area, e.g., Building 1421, 2nd Floor, Rm 201)
(3) A description of material to be abated (example: horizontal pipe, cement wall panels, tile, stucco, etc.) type of asbestos (chrysotile, amosite, crocidolite, etc.); and % asbestos content.
(4) Technique to be used: Removal = REM; Encapsulation = ENCAP; Encasement = ENCAS; Enclosure = ENCL; Repair = REP.
(5) Class designation: Class I, II, III, or IV (OSHA designation).
(6) Friability of materials: Check the applicable EPA NESHAP friability designation.
(7) Form: Interior or Exterior Architectural = IA or EA; Mechanical/Electrical = ME.
    Condition: Good = G; Fair = F; Poor = P.
(8) Quantity of ACM for each work task in meters or square meters.
(8a) Quantity of ACM for each work task in linear feet or square feet.
(9) Response Action Detail Sheet specifies the material to be abated and the methods to be used. There is only one Response Action Detail Sheet for each abatement task.
(10) Set-up Detail Sheets indicate containment and control methods used in support of the response action (referenced in the selected Response Action Detail Sheet).

TABLE 2

FORMULA FOR CALCULATION OF THE 95 PERCENT CONFIDENCE LEVEL
(Reference: NIOSH 7400)

---

Fibers/cc(01.95 percent CL) = X + [(X) * (1.645) * (CV)]

Where: X = ((E)(AC))/((V)(1000))

E = ((F/Nf) - (B/Nb))/Af

CV = The precision value; 0.45 shall be used unless the analytical laboratory provides the Contracting Officer with documentation (Round Robin Program participation and results) that the laboratory's precision is better.

AC = Effective collection area of the filter in square millimeters

V = Air volume sampled in liters

E = Fiber density on the filter in fibers per square millimeter

F/Nf = Total fiber count per graticule field

B/Nb = Mean field blank count per graticule field

Af = Graticule field area in square millimeters

TWA = C1/T1 + C2/T2 = Cn/Tn

Where: C = Concentration of contaminant

T = Time sampled.

TABLE 3

NIOSH METHOD 7400

PCM ENVIRONMENTAL AIR SAMPLING PROTOCOL (NON-PERSONAL)

| Sample Location | Minimum No. of Samples | Filter Pore Size (Note 1) | Min. Vol. (Note 2) (Liters) | Sampling Rate (liters/min.) |
|---|---|---|---|---|
| Inside Abatement Area | 0.5/140 Square Meters (Notes 3 & 4) | 0.45 microns | 3850 | 2-16 |
| Each Room in 1 Abatement Area Less than 140 Square meters | | 0.45 microns | 3850 | 2-16 |
| Field Blank | 2 | 0.45 microns | 0 | 0 |
| Laboratory Blank | 1 | 0.45 microns | 0 | 0 |

Notes:

1. Type of filter is Mixed Cellulose Ester.

2. Ensure detection limit for PCM analysis is established at 0.005 fibers/cc.

3. One sample shall be added for each additional 140 square meters. (The corresponding I-P units are 5/1500 square feet).

4. A minimum of 5 samples are to be taken per abatement area, plus 2 field blanks.

TABLE 4

EPA AHERA METHOD: TEM AIR SAMPLING PROTOCOL

| Location Sampled | Minimum No. of Samples | Filter Pore Size | Min. Vol. (Liters) | Sampling Rate (liters/min.) |
|---|---|---|---|---|
| Inside Abatement Area | 5 | 0.45 microns | 1500 | 2-16 |
| Outside Abatement Area | 5 | 0.45 microns | 1500 | 2-16 |
| Field Blank | 2 | 0.45 microns | 0 | 0 |
| Laboratory Blank | 1 | 0.45 microns | 0 | 0 |

Notes:

1. Type of filter is Mixed Cellulose Ester.
2. The detection limit for TEM analysis is 70 structures/square mm.

CERTIFICATE OF WORKER'S ACKNOWLEDGMENT

PROJECT NAME _____ CONTRACT NO. _____
PROJECT ADDRESS _____
CONTRACTOR FIRM NAME _____
EMPLOYEE'S NAME _____, _____, _____,
(Print) (Last) (First) (MI)

Social Security Number: _____-_____-_____,

WORKING WITH ASBESTOS CAN BE DANGEROUS. INHALING ASBESTOS FIBERS HAS BEEN LINKED WITH TYPES OF LUNG DISEASE AND CANCER. IF YOU SMOKE AND INHALE ASBESTOS FIBERS, THE CHANCE THAT YOU WILL DEVELOP LUNG CANCER IS GREATER THAN THAT OF THE NONSMOKING PUBLIC.

Your employer's contract for the above project requires that you be provided and you complete formal asbestos training specific to the type of work you will perform and project specific training; that you be supplied with proper personal protective equipment including a respirator, that you be trained in its use; and that you receive a medical examination to evaluate your physical capacity to perform your assigned work tasks, under the environmental conditions expected, while wearing the required personal protective equipment. These things are to be done at no cost to you. By signing this certification, you are acknowledging that your employer has met these obligations to you. The Contractor's Designated Industrial Hygienist will check the block(s) for the type of formal training you have completed. Review the checked blocks prior to signing this certification.

FORMAL TRAINING:

_____ a. For Competent Persons and Supervisors: I have completed EPA's Model Accreditation Program (MAP) training course, "Contractor/Supervisor", that meets this State's requirements.

b. For Workers:

_____ (1) For OSHA Class I work: I have completed EPA's MAP training course, "Worker", that meets this State's requirements.

_____ (2) For OSHA Class II work (where there will be abatement of more than one type of Class II materials, i.e., roofing, siding, floor tile, etc.): I have completed EPA's MAP training course, "Worker", that meets this State's requirements.

(3) For OSHA Class II work (there will only be abatement of one type of Class II material):

_____ (a) I have completed an 8-hour training class on the elements of 29 CFR 1926, Section .1101(k)(9)(viii), in addition to the specific work practices and engineering controls of 29 CFR 1926, Section .1101(g) and hands-on training.

_____ (b) I have completed EPA's MAP training course, "Worker", that meets this State's requirements.

_____ (4) For OSHA Class III work: I have completed at least a 16-hour course consistent with EPA requirements for training of local education agency maintenance and custodial staff at 40 CFR 763, Section .92(a)(2) and the elements of 29 CFR 1926, Section .1101(k)(9)(viii), in addition to the specific work practices and engineering controls at 29 CFR 1926, Section .1101, and hands-on training.

CERTIFICATE OF WORKER'S ACKNOWLEDGMENT

_____ (5) For OSHA Class IV work: I have completed at least a 2-hr course consistent with EPA requirements for training of local education agency maintenance and custodial staff at 40 CFR 763, (a)(1), and the elements of 29 CFR 1926, Section .1101(k)(9)(viii), in addition to the specific work practices and engineering controls at 29 CFR 1926, Section .1101(g) and hands-on training.

_____ c. Workers, Supervisors and the Designated Competent Person: I have completed annual refresher training as required by EPA's MAP that meets this State's requirements.

PROJECT SPECIFIC TRAINING:
_____ I have been provided and have completed the project specific training required by this Contract. My employer's Designated Industrial Hygienist and Designated Competent Person conducted the training.

RESPIRATORY PROTECTION:
_____ I have been trained in accordance with the criteria in the Contractor's Respiratory Protection program. I have been trained in the dangers of handling and breathing asbestos dust and in the proper work procedures and use and limitations of the respirator(s) I will wear. I have been trained in and will abide by the facial hair and contact lens use policy of my employer.

RESPIRATOR FIT-TEST TRAINING:
_____ I have been trained in the proper selection, fit, use, care, cleaning,maintenance, and storage of the respirator(s) that I will wear. I have been fit-tested in accordance with the criteria in the Contractor's Respiratory Program and have received a satisfactory fit. I have been assigned my individual respirator. I have been taught how to properly perform positive and negative pressure fit-check upon donning negative pressure respirators each time.

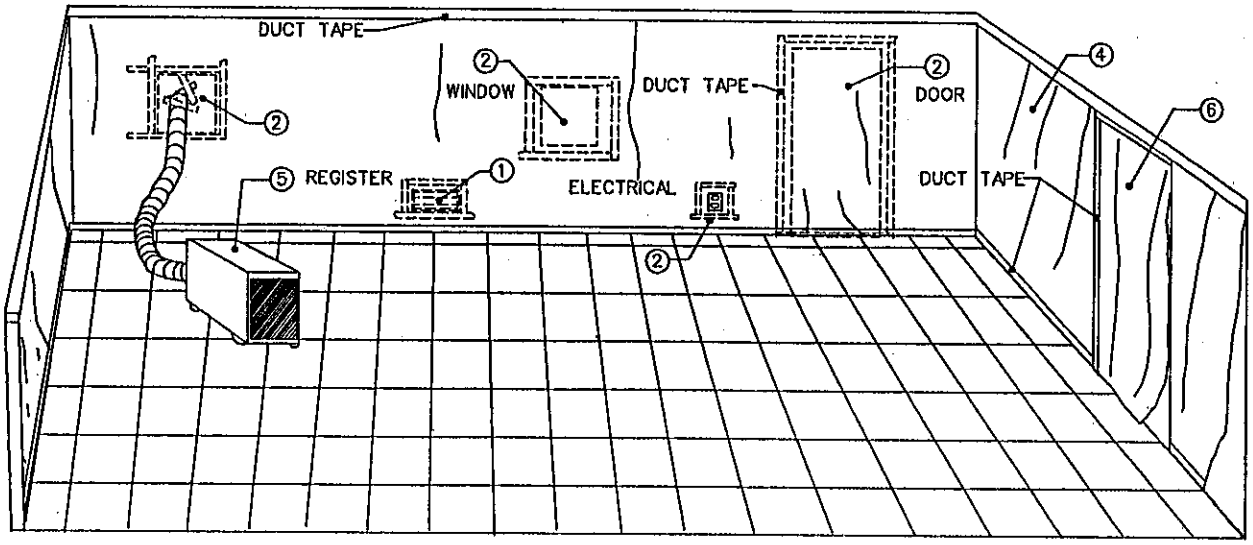
MEDICAL EXAMINATION:
_____ I have had a medical examination within the last twelve months which was paid for by my employer. The examination included: health history, pulmonary function tests, and may have included an evaluation of a chest x-ray. A physician made a determination regarding my physical capacity to perform work tasks on the project while wearing personal protective equipment including a respirator. I was personally provided a copy and informed of the results of that examination. My employer's Industrial Hygienist evaluated the medical certification provided by the physician and checked the appropriate blank below. The physician determined that there:

_____ were no limitations to performing the required work tasks.
_____ were identified physical limitations to performing the required work tasks.

Date of the medical examination _____

Employee Signature _____ date _____
Contractor's Industrial
Hygienist Signature _____ date _____

-- End of Section --



## Installation of critical barrier and full containment area (for vinyl tile floors)

1. Establish work area so that unauthorized entry is prevented; see sheet 11. Eliminate airflow into containment area by isolating all supply and return air ducts from mechanical system. Lock doors and windows not required for access.

2. Install 6-mil polyethylene critical barriers over all windows, doors, wall openings, electrical outlets, etc. Secure with duct tape on all sides. HEPA vacuum furniture, fixtures, and equipment and remove from or protect in containment area, as specified by the contract.

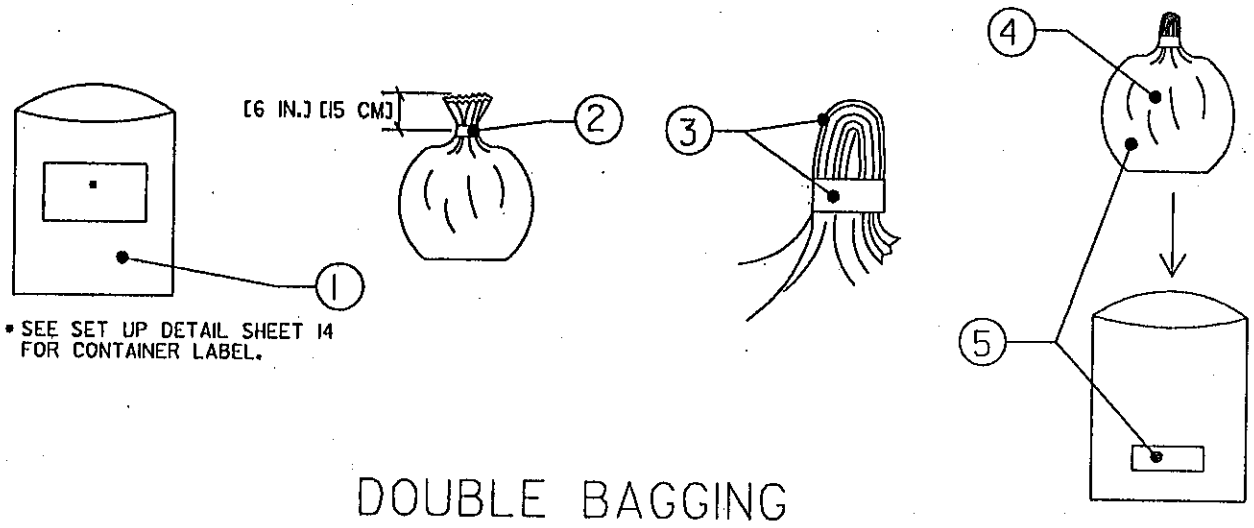
3. Prepare area as follows: turn off electrical power and remove light fixtures. Protect ceiling as required. HEPA vacuum floors and walls.

4. Protect wall surface with 6-mil polyethylene from floor to ceiling. Install viewing inspection windows, where feasible.

5. Install HEPA filter unit and duct work; see sheet 8.

6. Prepare door into decontamination unit or load-out unit; see sheet 22 for decontamination unit and sheet 20 for load-out unit. Doors that swing into the work area must be removed from hinges.

**Final clearance requirements.** After abatement has been completed, see sheet 18 for final clearance requirements.



DOUBLE BAGGING

## Containers—double bagging

1. Place the still-wet asbestos-containing and asbestos-contaminated material into a prelabled 6-mil polyethylene bag. Do not overfill. Do not use bag for asbestos-containing or asbestos-contaminated material that could puncture the bag. (See sheet 9C for packaging items that could puncture bags.)

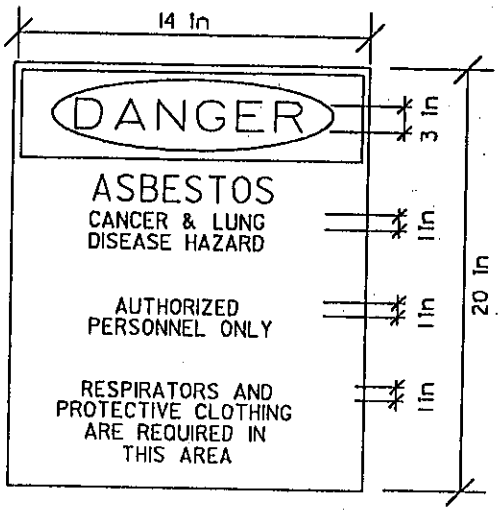
2. Evacuate with HEPA vacuum, and seal collapsed bag by twisting top [6 in] [15 cm] closed and wrapping with a minimum of two layers of duct tape.

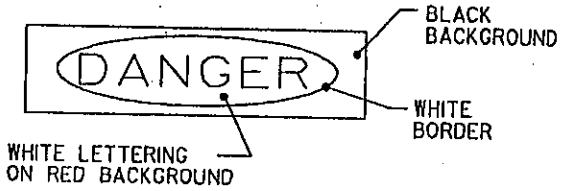
3. Twist top and fold over. Apply second wrap of duct tape.

4. Adequately wet clean outside of disposal bag by wet wiping, and take bag to the equipment and staging area.

5. Place bag inside a second prelabled 6-mil polyethylene bag.

6. Seal outer bag by repeating steps 2 and 3 above. Take bag to load-out unit; see sheet 20.





AREA WARNING SIGNS AND WARNING TAPE

DETAIL 011

## Area warning signs and warning tape

1. Provide and install [4 mil] [0.10 mm] polyethylene warning tape at locations shown on the abatement area plan.

2. Warning tape is to be attached to wood or metal posts at [10 ft] [300 cm] on center. Tape must be [3 ft] [100 cm] from ground.

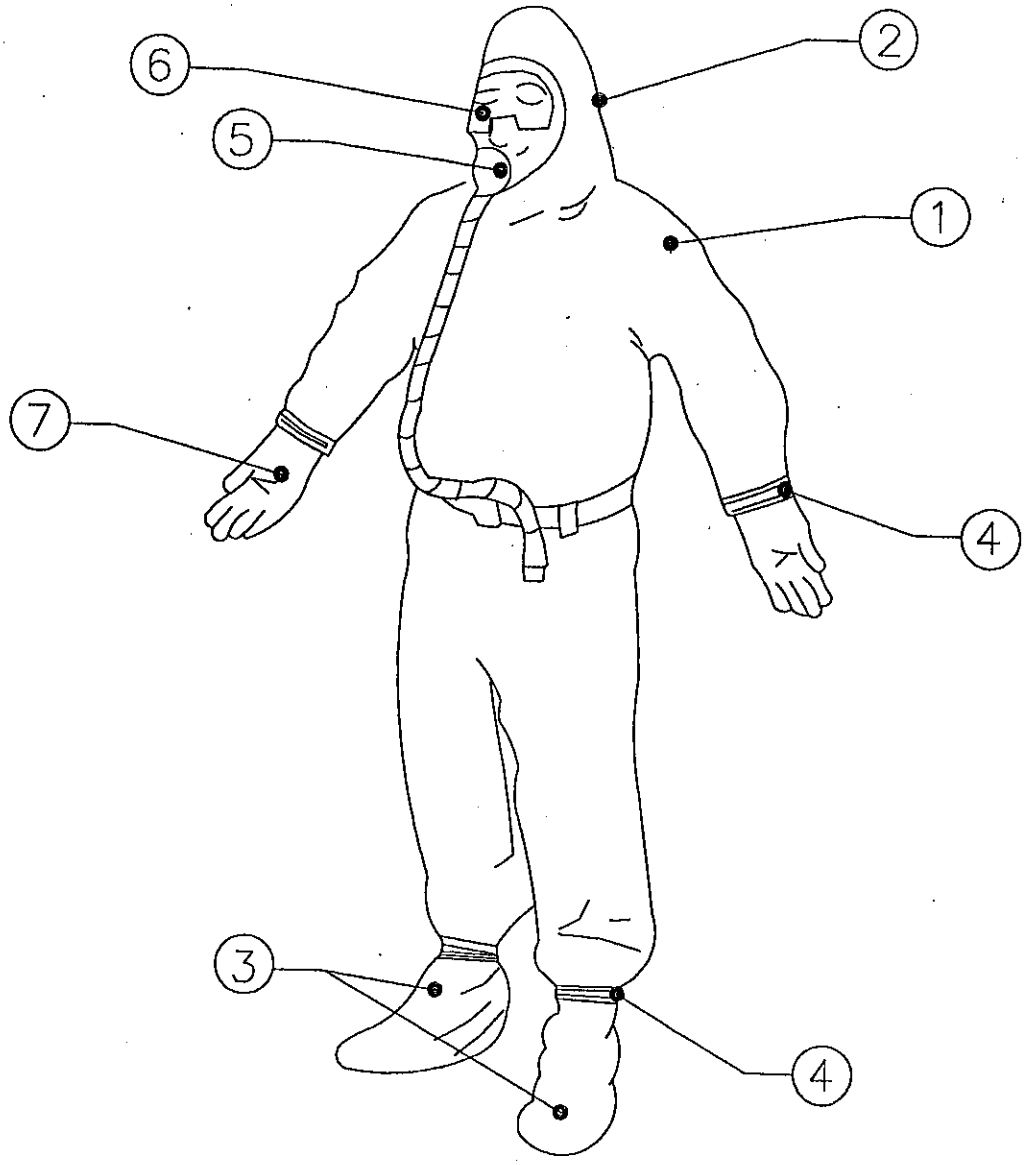
3. Attach both warning signs at each entrance of the work area and at [33 yd] [30 m] on center where security fencing is installed.

4. Warning signs must be in English and other languages required by the contract.

5. Install at eye level.

| FIBER CONCENTRATION | MINIMUM REQUIRED RESPIRATOR | |
|---|---|---|
| NOT IN EXCESS OF 1 FIBER/CC | HALF-MASK AIR PURIFYING RESPIRATOR WITH HEPA FILTERS | |
| NOT IN EXCESS OF 5 FIBERS/CC | FULL FACEPIECE AIR-PURIFYING RESPIRATOR WITH HEPA FILTERS | |
| NOT IN EXCESS OF 10 FIBERS/CC | LOOSE FITTING HELMET OR HOOD, POWERED AIR-PURIFYING RESPIRATOR WITH HEPA FILTERS | |
| NOT IN EXCESS OF 10 FIBERS/CC | POWERED AIR-PURIFYING RESPIRATOR WITH FULL FACEPIECE AND HEPA FILTER | |
| NOT IN EXCESS OF 10 FIBERS/CC | LOOSE FITTING HELMET OR HOOD, SUPPLIED AIR RESPIRATOR OPERATED IN CONTINUOUS FLOW MODE WITH BACK-UP HEPA FILTER | |
| NOT IN EXCESS OF 10 FIBERS/CC | SUPPLIED AIR RESPIRATOR WITH FULL FACEPIECE OPERATED IN CONTINUOUS FLOW MODE WITH BACK-UP HEPA FILTER | |
| NOT IN EXCESS OF 100 FIBERS/CC | FULL FACEPIECE SUPPLIED AIR RESPIRATOR OPERATED IN PRESSURE-DEMAND MODE WITH BACK-UP HEPA FILTER | |
| GREATER THAN 100 FIBERS/CC OR UNKNOWN CONCENTRATION | FULL FACEPIECE SUPPLIED-AIR RESPIRATOR OPERATED IN PRESSURE-DEMAND MODE WITH AUXILIARY POSITIVE-PRESSURE SELF-CONTAINED BREATHING APPARATUS |   |

**Respiratory protection table**



## Protective clothing

1. Disposable or reusable full body suit with elastic around hood and shoe cover openings is required or as otherwise specified in the contract.

2. Hood shall be worn over respirator's head and neck straps.

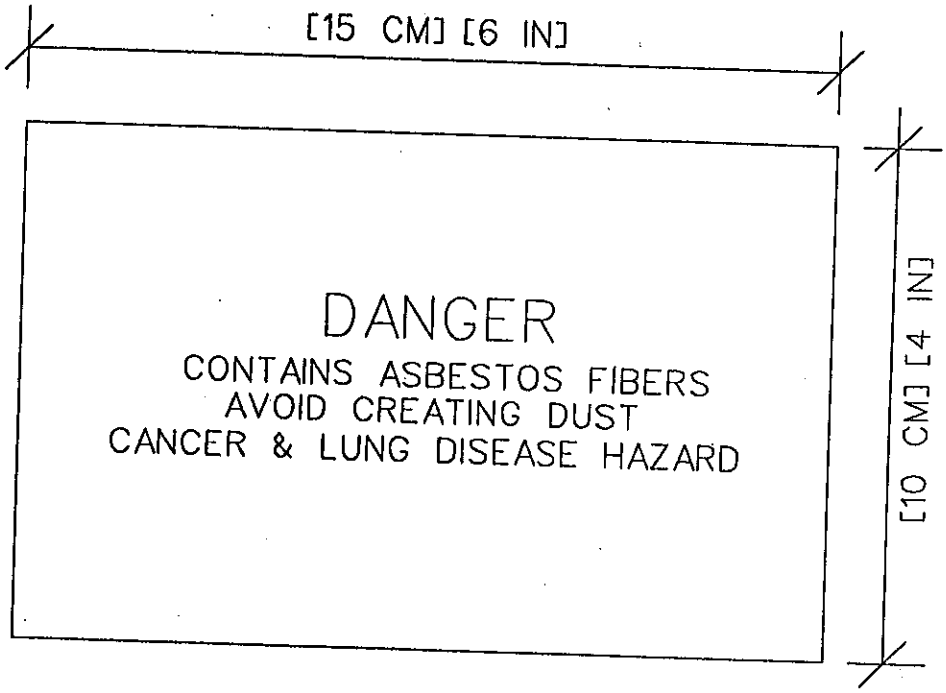
3. Shoe covers shall be worn over work shoes.

4. Cuffs shall be taped with duct tape at wrists and ankles in order to prevent infiltration.

5. Cartridge-type air-purifying HEPA filter respirator is minimal requirement. Type shall be selected in accordance with sheet 12.

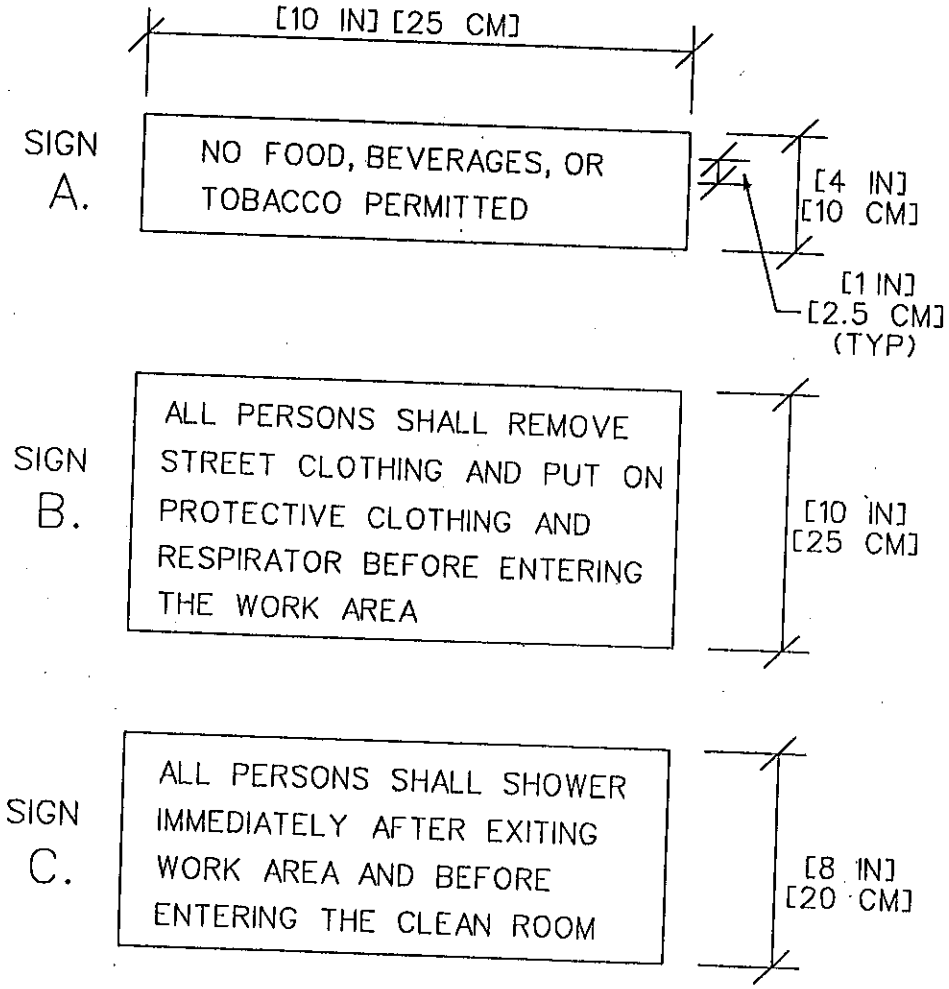
6. If eye protection is not integral with respirator, protection goggles are required.

7. Rubber work gloves are recommended to be worn alone or under outer work gloves provided for hand and operation safety.



**Disposal container label**

Attach warning labels to each disposal container removed from abatement area.



## Decontamination unit signage

1. Provide signs in English and other languages required by the contract.
2. Install at eye level.

## Certification of Final Cleaning And Visual Inspection

Individual abatement task as identified in paragraph, Description of Work _____

In accordance with the cleaning and decontamination procedures specified in the Contractor's asbestos hazard abatement plan and this contract, the Contractor hereby certifies that he/she has thoroughly visually inspected the decontaminated regulated work area (all surfaces, including pipes, beams, ledges, walls, ceiling, floor, decontamination unit, etc.) in accordance with ASTM E1368, *Standard Practice for Visual Inspection of Asbestos Abatement Projects*, and has found no dust, debris, or asbestos-containing material residue.

BY: (Contractor's signature) _____ Date _____
Print name and title _____

(Contractor's Onsite Supervisor signature) _____ Date _____
Print name and title _____

(Contractor's Industrial Hygienist signature) _____ Date _____
Print name and title _____

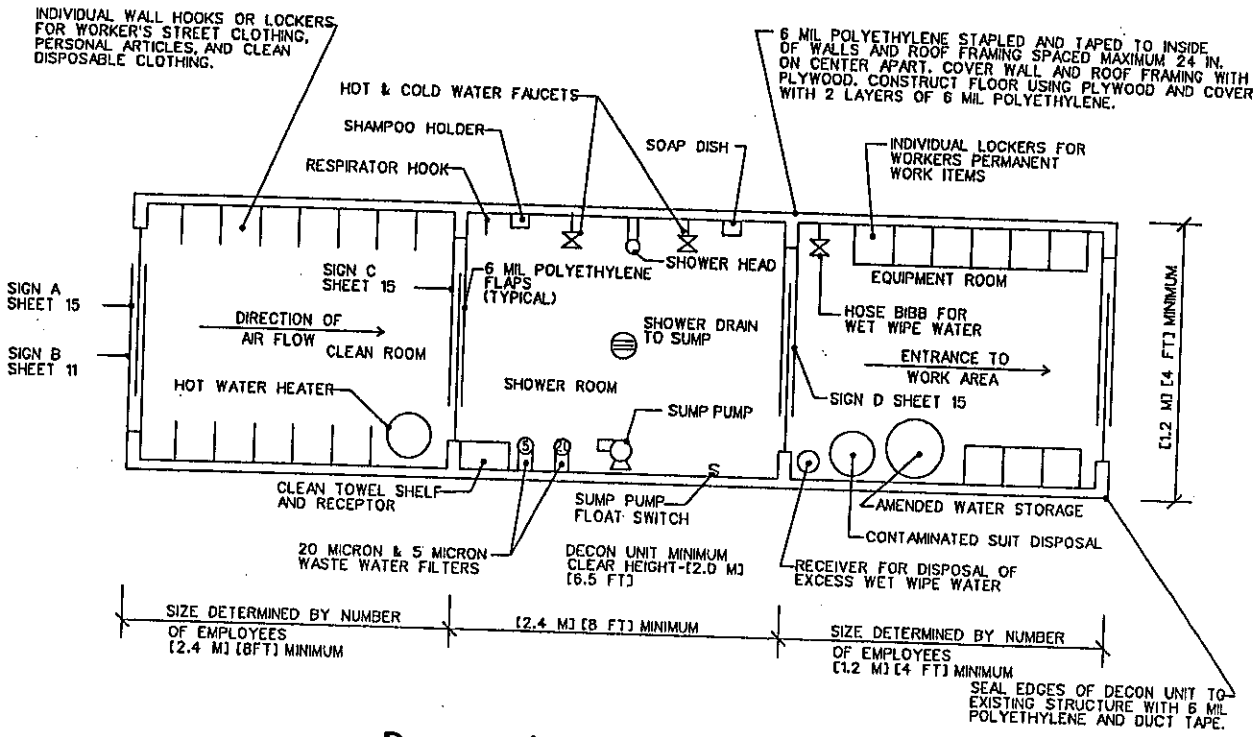
### Contracting Officer Acceptance or Rejection

The Contracting Officer hereby determines that the Contractor has performed final cleaning and visual inspection of the decontaminated regulated work area (all surfaces including pipes, beams, ledges, walls, ceiling, floor, decontamination unit, etc.) and by quality assurance inspection, finds the Contractor's final cleaning to be:

☐ Acceptable

☐ Unacceptable, Contractor instructed to reclean the regulated work area.

BY: Contracting Officer's Representative
Signature _____ Date _____
Print name and title _____



## Decontamination unit floor plan

1. Establish work area so that unauthorized entry is prevented; see sheets 11 and 15. Before entering the work area, all personnel shall remove their street clothing in the clean room and put on protective clothing and respirator.

2. Whenever exiting the work area, all personnel shall:

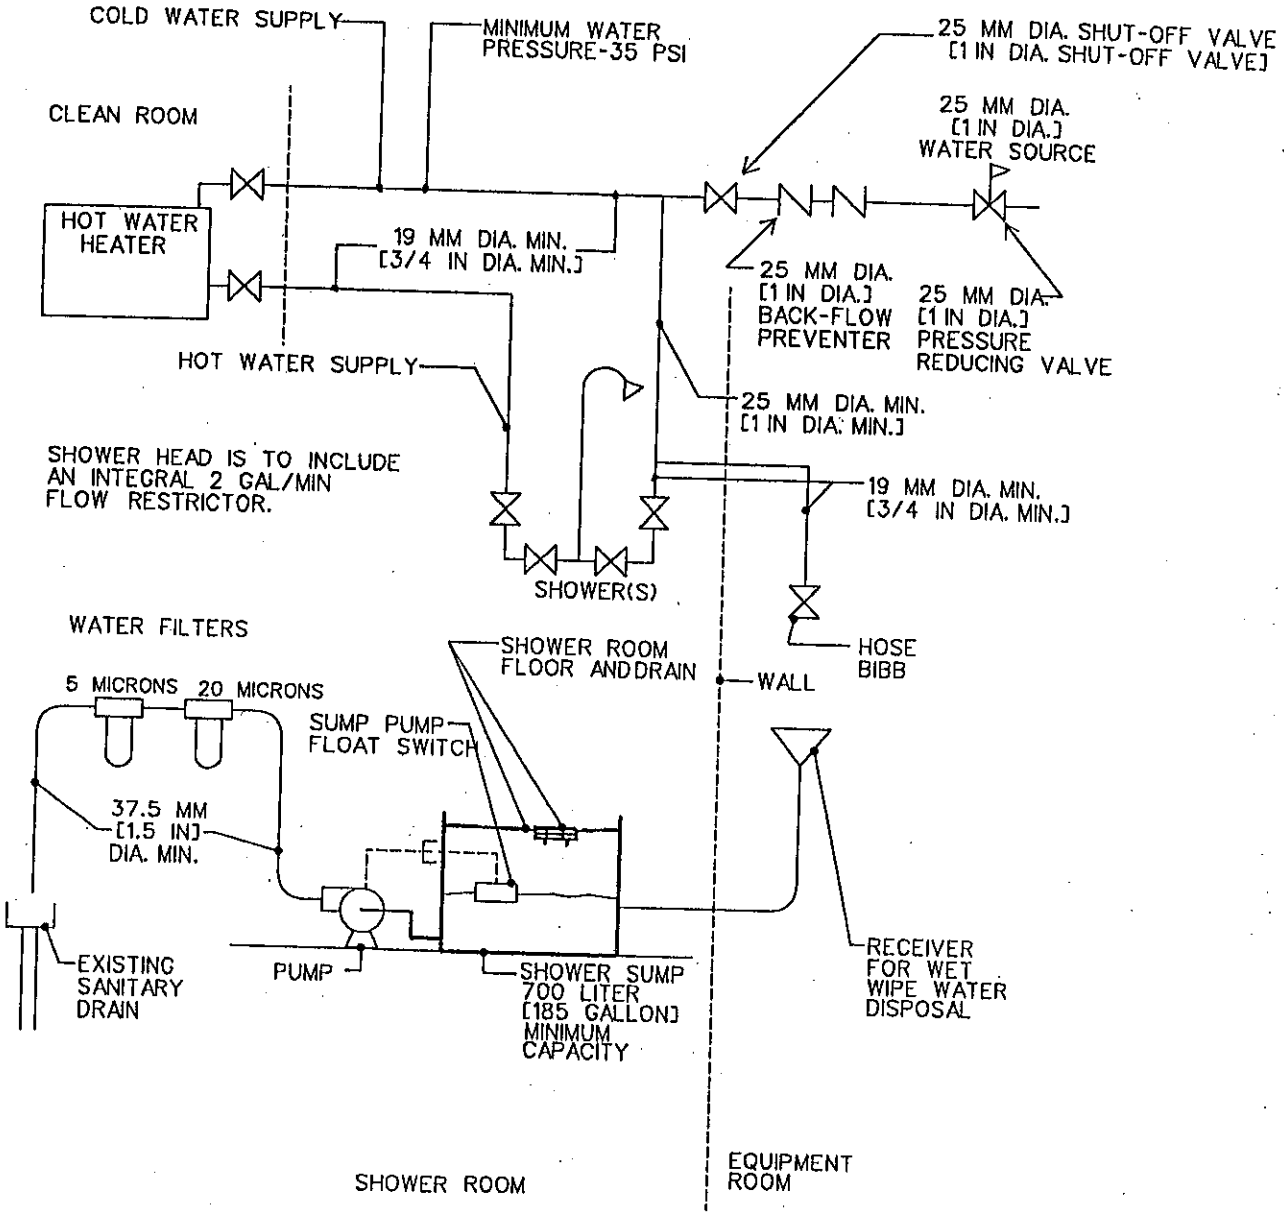
- Vacuum clothing and shoes outside equipment room.
- Remove all clothing and equipment (except respirator) in equipment room.
- Store work shoes and equipment in locker.
- With respirator still on, shower thoroughly, including hair. Then remove respirator and finish shower.
- Proceed to clean room and put on street clothes.

3. See sheet 23 for minimum plumbing requirements, including wastewater filtration. Ensure that plumbing and specified filter size meet local requirements.

4. Twice daily, or more often if necessary, and before breaking down decontamination unit after abatement, adequately wet clean and HEPA vacuum all wall, floor, equipment, and other surfaces. Waste collected in shower room and equipment room shall be treated as asbestos-contaminated material. Place in approved container; see sheet 9. Apply labels; see sheet 14.

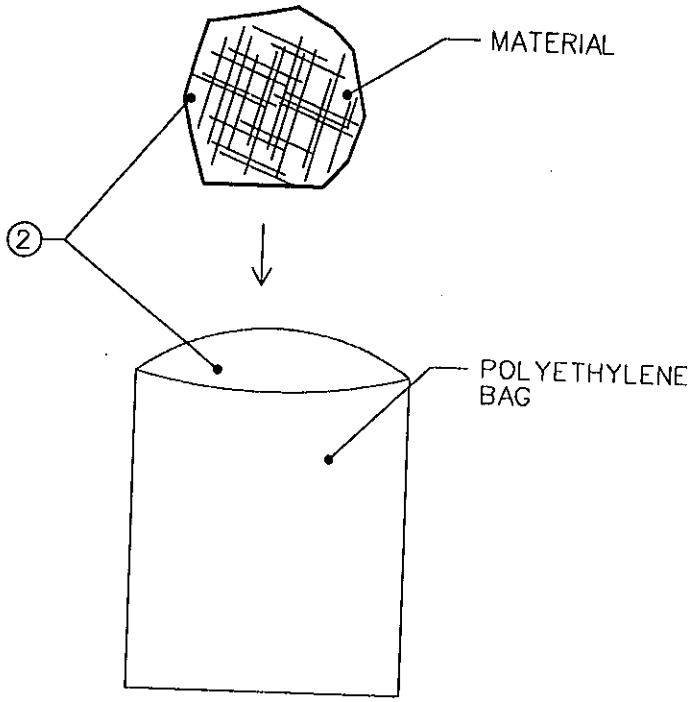
5. Prepare for final clearance.

**Final clearance requirements.** Contractor and Contracting Officer will certify visual inspection of work area on sheet 19, *Certification of Final Cleaning and Visual Inspection*. Contract designee(s) will conduct final air clearance monitoring as required by the contract. If the unit is not a prefabricated decontamination unit, apply lockdown encapsulant before final air clearance monitoring. After approval of final air clearance, break down and treat polyethylene as asbestos contaminated material. Place in approved container; see sheet 9. Apply labels; see sheet 14. Dispose of as required by the contract.



SIZE CAPACITY OF SUMP PUMP FOR TWICE THE EXPECTED WASTE WATER FLOW.

**Decontamination unit piping details**



## Removal of miscellaneous asbestos-containing materials

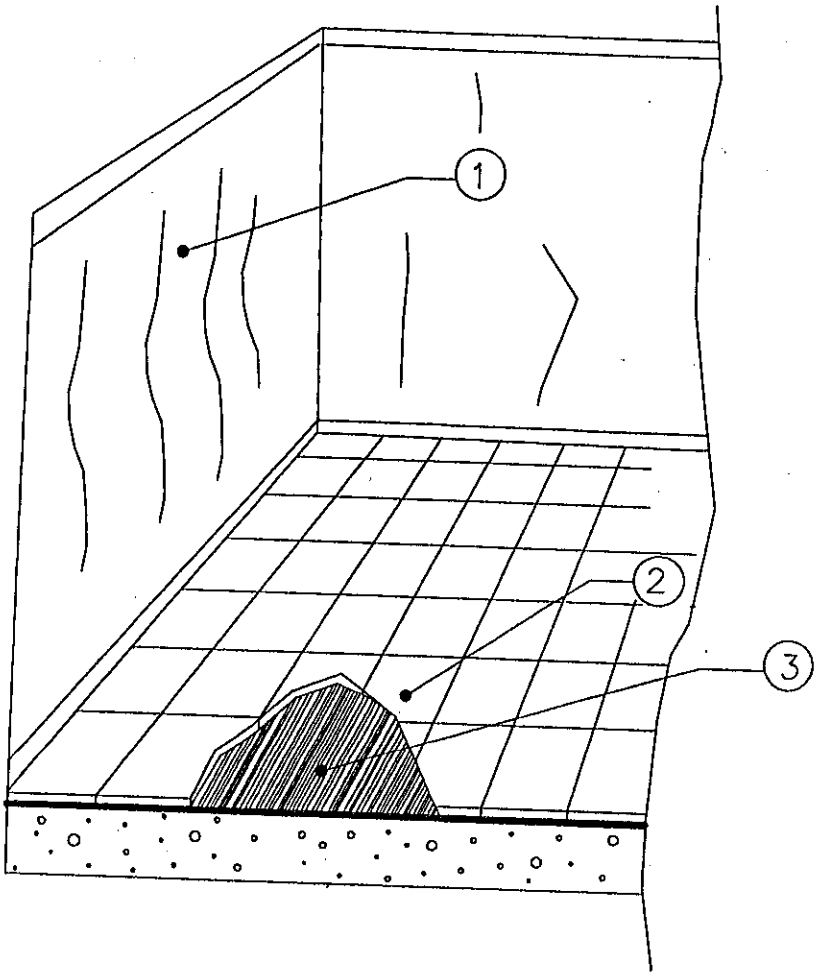
1. Establish work area so that unauthorized entry is prevented; see sheet 11. Prepare containment area as specified on sheet 21.

2. Adequately wet mist materials with amended water. Remove and place in approved container; see sheet 9. Apply labels; see sheet 14.

3. HEPA vacuum and wet wipe area in the immediate vicinity of removed materials.

4. Prepare area for final clearance.

5. Carry out final clearance requirements as specified on sheet 21.



## Removal of vinyl asbestos tile adhered to concrete floor system by asbestos-containing adhesive

1. Prepare containment area as specified on sheet 21. NOTE: Where full containment area is required, follow instructions on sheet 4, except omit polyethylene on floor.

2. Lightly flood asbestos tile with amended water, and let soak for 48 hours. Remove asbestos tile and adhesive while they are wet in order to prevent asbestos fiber release. Place tile and adhesive into an approved container; see sheet 9. Apply labels; see sheet 14.

3. Clean, HEPA vacuum, and wet wipe all surfaces.

4. Inspect and reclean area as necessary.

5. Prepare area for final air clearance.

6. Carry out final clearance requirements as specified on applicable sheet 18 or 21.

## 1.2 DEFINITIONS

a. Lead Hazard Control Activity - Any construction work where a worker may be occupationally exposed to lead and procedures have to be followed to assure that: 1). Lead inside the lead hazard control area is cleaned up to appropriate levels and 2). Lead dust does not disperse outside the lead hazard control area at unacceptable levels.

b. Public/Commercial Building - Buildings on real property, including residential real property, generally accessible to the public except target housing, child occupied facilities and industrial buildings. Examples include offices, stores/shopping centers, churches, schools, barracks, hospitals, museums, airports, hotels, convention centers.

## 1.3 DESCRIPTION OF WORK

The work covered by this section includes work tasks, on the individual work task data sheets at the end of this section, and the precautions specified in this section for the protection of workers, building occupants and the environments.

The Contractor shall be responsible to remove any loose and flaking paint on horizontal and vertical surfaces that will remain inplace. The Contractor will be responsible to encapsulate areas of removal.

### 1.3.1 Protection of Existing Areas To Remain

All project work including, but not limited to, lead hazard work, storage, transportation, and disposal shall be performed without damaging or contaminating adjacent work and areas. Where such work or areas are damaged or contaminated, the Contractor shall restore work and areas to the original condition at no additional cost to the Government.

### 1.3.2 Coordination with Other Work

The contractor shall coordinate lead hazard control activities with work being performed in adjacent areas. Coordination procedures shall be explained in the Contractor's Accident Prevention Plan and shall describe how the Contractor will prevent lead exposure to other contractors and/or Government personnel performing work unrelated to lead hazard control activities.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES:

SD-03 Product Data

Materials and Equipment
Expendable Supplies

A description of the materials, equipment and expendable supplies required; including Material Safety Data Sheets (MSDSs) for material brought onsite to perform the work.

Qualifications; G

A report providing evidence of qualifications and designating responsibilities for personnel and laboratories.

SD-06 Test Reports

Pressure Differential Log
Licences, Permits, and Notifications; G
Accident Prevention Plan (APP); G

A report describing how the Contractor will protect workers, building occupants, and building contents while performing lead hazard control activities; and how project clearance will be performed.

Sampling and Analysis; G

A log of the analytical results required for the sampling. The log shall be kept current.

Clearance Report; G

Report prepared by the QSHP.

## 1.5 QUALIFICATIONS

### 1.5.1 Qualifications and Organization Report

The Contractor shall furnish a qualification and organization report. The report shall describe the qualifications of the qualified safety and health professional (QSHP), onsite safety and health supervisor (OSHS), labor staff and the independent risk assessor. The report shall include an organization chart showing the Contractor's personnel by name and title and

project specific responsibilities and authorities. The report shall describe the qualifications of the laboratories selected for this project. The report shall be signed by the Contractor and the qualified safety and health professional to indicate that all personnel and laboratories comply with certification and experience requirements of this section and that project personnel have been given the authority to complete the tasks assigned to them.

1.5.2 Personnel and Subcontractor Responsibilities and Qualifications

1.5.2.1 Qualified Safety and Health Professional (QSHP)

The QSHP shall be responsible for development of project specific requirements in the Accident Prevention Plan (APP); supervise implementation of the APP requirements; visit the site as needed to verify effectiveness of the APP and to coordinate resolution of unknown situations that may develop as the work progresses; be available to provide consultation to the Onsite Safety and Health Supervisor (OSHS); review sampling and analytical results to evaluate occupational exposure levels, verify effectiveness of controls and determine if clearance requirements have been met. The QSHP shall have demonstrable experience with the implementation of occupational safety and health regulations.

1.5.2.2 Lead Hazard Control Workers

Lead Hazard Control workers shall be responsible for performing the labor necessary to complete the lead hazard control activities required in this contract.

1.5.2.3 Independent Certified Risk Assessor

The independent Certified Risk Assessor shall be a subcontractor to the prime Contractor on the project. The risk assessor shall be responsible to perform the sampling and evaluating the analytical data to verify clearance levels have been achieved. The independent risk assessor shall sign the clearance report indicating clearance requirements for the contract have been met.

1.5.2.4 Testing Laboratories

The laboratory selected to perform analysis on paint chip, soil or dust wipe samples shall be accredited by EPA's National Lead Laboratory Accreditation Program (NLLAP). The laboratory selected perform analysis on worker exposure (industrial hygiene) samples shall be in the American Industrial Hygiene Association's Industrial Hygiene Laboratory Accreditation Program (IHLAP) and shall be successfully participating in the Proficiency Analytical Testing (PAT) program for lead.

1.5.2.5 Blood Lead Testing

The laboratory selected to perform analysis on worker blood samples shall be approved by OSHA and meet the requirements contained in http://www.osha-slc.gov/OCIS/toc_bloodlead.html.

1.5.2.6 Disposal Facility and Transporter

The Contractor shall furnish written evidence that the landfill to be used is approved for lead disposal by USEPA and state and local requirements. Copies of any required signed agreements between the Contractor (including

subcontractors and transporters) and the lead disposal facility shall be provided.

## 1.6 REGULATORY REQUIREMENTS

In addition to the detailed requirements of this specification, work shall be performed in accordance with requirements of EM 385-1-1 and applicable regulations including, but not limited to 29 CFR 1910, 29 CFR 1926, especially Section .62, and the accepted Accident Prevention Plan with Appendices. Matters of interpretation of the standards shall be resolved to the satisfaction of and with the concurrence of, the Contracting Officer before starting work. Where these requirements vary, the most stringent shall apply. The following State and local statutes, regulations and requirements apply to lead hazard control activities to be performed: State, HIOSH 12-148.

## 1.7 ACCIDENT PREVENTION PLAN (APP)

### 1.7.1 APP Content and Organization

The Contractor's Accident Prevention Plan shall be organized into 5 parts, consisting of the overall plan and 4 appendices. The overall plan shall address each element in Appendix A of EM 385-1-1 in project specific detail. The elements are: a. Signature Sheet, b. Background Information, c. Statement of Safety and Health Policy, d. Responsibilities and Lines of Authorities, e. Subcontractors and Suppliers, f. Training, g. Safety and Health Inspections, h. Safety and Health Expectations, Incentive Programs and Compliance, i. Accident Reporting, j. Medical Support, k. Corporate Plans and Programs required by this contract, (HAZCOM, Respiratory Protection).

#### 1.7.1.1 Lead Hazard Control Plan Appendix

The Lead Hazard Control Appendix shall address occupational exposure issues and shall describe the procedures to be followed to protect employees from lead hazards while performing lead hazard control activities. Each of the following elements shall be addressed in the lead hazard control appendix:

a. The location and a brief description of each work activity that will emit lead into the workplace atmosphere. A description of any components containing lead shall be included and keyed to the project drawings.

b. Description of equipment and materials, controls, crew size, worker responsibilities, and operating and maintenance procedures.

c. Description and sketch of the Lead Hazard Control Areas, including decontamination areas.

d. Description of the specific lead control methods and procedures to protect workers and other onsite contractors from lead exposure.

e. Technologic equipment used to keep occupational exposure below the Permissible Exposure Limit and minimize worker exposure to lead (i.e., HEPA-filtered vacuum equipment/cleaners, special negative air enclosure equipment and supplies, etc.).

f. Worker Exposure Assessment including methods and procedures to monitor and document worker exposure to lead. Worker exposure

monitoring shall be broken into two parts in the plan. Part A: Initial Determination. The Contractor shall describe worker monitoring (if performed for the "initial determination" described in 29 CFR 1926 (.62) (d). Monitoring for the initial determination may be omitted from the plan if the Contractor has sufficient proof from previous operations as specified in 29 CFR 1926 (.62) (d)(3)(iii) and (iv) that workers will not be exposed over the action level. The Contractor shall substitute objective proof of action level compliance in Part A if "initial determination" monitoring is omitted. Part B: Continued Exposure Monitoring. Worker exposure monitoring after the initial lead exposure determination has been made.

g. Work Practices Program describing the protective clothing to be used to protect workers from lead exposure, house keeping procedures employed to minimize spread on lead contamination in the lead hazard control area, hygiene facilities and practices used to prevent workers from inadvertent ingestion of lead.

h. Administrative Control Procedures, to be used as a last resort, to limit worker exposure to lead. The worker rotation schedule to be employed, should engineering or personal protective equipment precautions fail to be effective, shall be described. This element of the plan shall be omitted if administrative controls will not be used.

i. Medical Surveillance practices and procedures used to monitor worker exposure to lead and to assure fitness for wearing respiratory protection devices.

j. Worker training meeting the requirements of 29 CFR 1926 Sections (.62) and (.59) to assure workers understand hazard associated with working with lead and how to protect themselves.

k. Security: The Contractor shall demarcate work area with caution tape. The Contractor will have sole control on entry and exit from work site for each lead hazard control area. A log book shall be kept documenting entry into and out of the lead hazard control area. Entry into lead hazard control areas shall only be by personnel authorized by the Contractor and the Contracting Officer. Persons entering control areas shall be trained, medically evaluated, and equipped with personal protective equipment required for the specific control area to be entered.

1.7.1.2 Activity Hazard Analyses Appendix

An Activity Hazard Analysis (AHA) shall be prepared for each work task data element specified on the individual work task data element sheets at the end of this section. The AHA shall be submitted to the Contracting Officer prior to beginning specified work. Format shall be in accordance with EM 385-1-1, figure 1-1. The AHA shall be continuously reviewed and modified, when appropriate, to address changing conditions or operations. Each accepted AHA shall be appended to and become part of the APP.

1.7.1.3 Clearance Plan Appendix

The Contractor shall develop a Clearance Plan describing practices and procedures used to assure that lead hazard control activities are complete and that lead contamination within the lead hazard control area comply with

final clearance levels or visual clearance criteria. Sampling and analysis procedures used to document project completion and clearance goals shall be explained in the Clearance Plan Appendix.

1.7.2 Lead Hazard Information Pamphlet Distribution

Prior to commencing lead hazard control activities, the Contractor shall provide owners/occupants who are affected by the project as defined in 40 CFR 745.Subpart E, the EPA 747-K-99-001. The pamphlet shall be provided in compliance with 40 CFR 745 (.80) through 40 CFR 745 (.88). The Contractor shall collect signatures from affected residents acknowledging they have been informed of planned lead hazard control activities.

1.8 PRE-CONSTRUCTION SAFETY CONFERENCE

1.8.1 Conference General Requirements

The Contractor and the QSHP shall attend a pre-construction safety conference prior to starting work. Items required to be submitted shall be reviewed for completeness, and where specified, for acceptance. Details of the APP shall be revised to correct any deficiencies, and resubmitted for acceptance. Onsite work shall not begin until the APP has been accepted, unless otherwise authorized by the Contracting Officer. One copy of the APP shall be maintained in the Contractor's jobsite file, and a second copy shall be posted where it will be accessible to personnel on the site. As work proceeds, the APP shall be adapted to new situations and conditions. Changes to the APP shall be made by the QSHP with acceptance by the Contracting Officer. Should an unforeseen hazard become evident during performance of the work, the QSHP shall inform the Contracting Officer, both verbally and in writing, for immediate resolution. In the interim, the QSHP shall take necessary action to re-establish and maintain safe working conditions; and to safeguard onsite personnel, visitors, the public, and the environment. Disregard for provisions of this specification, or the accepted APP, shall be cause for stopping of work until the matter is rectified.

1.8.2 Preparatory Inspection Meeting

The Contractor shall arrange and hold a preparatory inspection meeting to review completeness and adequacy of the APP immediately prior to beginning each phase of work.

1.9 MEDICAL SURVEILLANCE REQUIREMENTS

The Contractor shall comply with the following medical surveillance requirements:

a. The Contractor shall make every attempt to keep occupational exposure to lead on this project below the action level of 30 micrograms/cubic meter defined in 29 CFR 1926 (.62). If it is not possible, and if occupational exposures could possibly exceed the action level for 30 or more days per year, the Contractor shall institute a medical surveillance program. The program shall meet the examination frequency and content requirements specified in paragraph (j)(1), (j)(2) and (j)(3) of 29 CFR 1926 (.62). Medical removal as specified in paragraph (k) of 29 CFR 1926 (.62), if necessary, shall be at the Contractor's expense.

b. Medical surveillance and biological monitoring shall be in

compliance with 29 CFR 1926 (.62) (g) and (j). Initial biological monitoring shall be performed on lead hazard control workers prior to assignment to the project. Workers shall not be assigned to the project if results indicate a need for restricted activities.

c. All lead hazard control workers shall pass the medical examinations necessary to be approved by the occupational physician to wear respiratory protection on this project. Occupational physician's approval shall be given prior to assignment to the project.

## 1.10 RESPIRATORY PROTECTION PROGRAM

The Contractor shall have a written respiratory protection program and shall be fully capable of implementing the requirement of the respiratory protection program on this project. The respiratory protection program shall meet the requirements of 29 CFR 1926 (.62) and 29 CFR 1910 (.134). Project specific respiratory protection requirements shall be included in the lead hazard control plan appendix of the Contractor's accident prevention plan.

## 1.11 LICENCES, PERMITS AND NOTIFICATIONS

The Contractor shall certify in writing to the Regional Office of the EPA state's environmental protection agency responsible for lead hazard activities and the Contracting Officer at least 10 days prior to the commencement of work that licenses, permits and notifications have been obtained. The Contractor is responsible for all associated fees or costs incurred in obtaining the licenses, permits and notifications.

## 1.12 TRAINING

### 1.12.1 OSHA Training Requirements

All Contractor personnel and/or subcontractors performing or responsible for onsite oversight of lead hazard control activities shall meet the following training requirements.

a. Content of 29 CFR 1926 (.62) and its appendices.

b. How operations could result in exposure over the action level.

c. Purpose, selection, fitting, use and limitations of respirators.

d. Purpose and description of the medical surveillance program.

e. Use of engineering controls and good work practices to limit occupational exposure to lead.

f. Implementation of the lead hazard control plan appendix of the accident prevention plan.

g. Medical supervision for the use of chelating agents.

h. Employee right of access to medical surveillance records as specified in 29 CFR 1910 (.20).

### 1.12.2 Qualified Safety and Health Professional

The qualified safety and health professional shall meet the training requirements in paragraph 1.12.1 and shall meet the training, experience and authority requirements in 29 CFR 1926 (.62) to be a competent person and be trained and have the experience and education to meet 40 CFR 745 Subpart L requirements to carry the following certifications:

a. Certified Risk Assessor
b. Certified Project Designer
c. Certified Supervisor

1.12.3 Independent Risk Assessor

The independent risk assessor shall meet the training requirements in paragraph OSHA Training Requirements, above, and shall meet the training and experience requirements in40 CFR 745 to carry certification as a certified risk assessor.

1.12.4 Abatement Worker

Workers shall meet the OSHA Training Requirements specified above and the training requirements in 40 CFR 745 Subpart L to carry certification as a Certified Worker, if required.

1.12.5 Training Program Certification

Training to meet 40 CFR 745 Subpart L requirements shall be provided by an EPA accredited training provider and the Contractor shall provide proof in the Qualifications and Organization Report showing that personnel have passed certification examinations for their respective disciplines, that fees for certification have been paid to the EPA (or to the state for state-run programs) and that EPA has certified the QSHP, independent risk assessor, certified workers to perform their duties.

1.13 ANALYSIS

The assumption due to the age of the building is that all painted surfaces contain lead.

1.13.1 Analytical Procedures

1.13.1.1 Analysis Methods

Analysis shall conform to NIOSH Pub No. 84-100 Method 7082, Lead, for personal sampling required by 29 CFR 1926 (.62), ASTM E 1613. Sampling shall conform to ASTM E 1553 and ASTM E 1741.

1.13.1.2 Paint Chip Sampling and Analysis

Analysis shall conform to ASTM E 1613.

1.13.1.3 Dust Wipe Materials, Sampling and Analysis

Analysis shall conform to ASTM E 1613.

1.13.1.4 Soil Sampling and Analysis

Sampling shall conform to ASTM E 1727, ASTM E 1726, Analysis shall conform to ASTM E 1613.

1.13.2 Occupational Exposure Assessment

Sampling and analytical procedures to determine compliance with the occupational exposure monitoring requirement of this section shall be described in the lead hazard control plan appendix of the Contractor's accident prevention plan. Monitoring for the initial determination may be omitted if the Contractor has sufficient proof from previous operations as specified in 29 CFR 1926 (.62) (d)(3)(iii) and (iv) that workers will not be exposed over the action level. The following occupational exposure monitoring requirements apply and shall be implemented if the requirements of 29 CFR 1926 (.62)(d)(3) (iii) and (iv) cannot be demonstrated.

a. During Initial Monitoring the Contractor shall representatively sample employees with the greatest potential for exposure to aerosolized lead.

b. Continued/Additional Monitoring shall meet applicable paragraphs in 29 CFR 1926 (.62)(d)(6), Frequency, after the initial determination has been made.

1.13.3 Lead Hazard Control Area/Containment Monitoring

The Contractor shall perform a visual inspection once per day outside the lead hazard control area to assure visual clearance criteria are maintained while lead hazard control activities are performed. The Contractor shall clean at its own expense, and to the Contracting Officer's satisfaction, all contaminated surfaces outside the lead hazard control area, if surfaces fail visual clearance criteria.

1.13.4 Occupancy During Work

The Contractor shall wipe sample a floor surface at a location no more than 10 feet outside the lead hazard control area at a frequency of once per day while lead hazard control activities are being performed. Wipe sampling analytical results shall pass clearance criteria for floors specified in this contract. The Contractor shall clean all contaminated surfaces at its own expense and to the Contracting Officer's satisfaction, if floor wipe samples required in this paragraph fail clearance criteria.

1.13.5 Clearance Monitoring

Sampling and analytical procedures to determine the clearance requirements of this section shall be described by the Contractor in the Clearance Plan Appendix of the Accident Prevention Plan. The Contractor shall perform the following sampling and analysis to verify that clearance requirements for the contract (inside the lead hazard control) area have been met.

a. The Contractor shall take dust wipe samples inside the lead hazard control area after the final visual inspection in the quantities and at the locations specified.

   (1) Floors 3 per floor.

b. The Contractor shall take exterior bare soil samples inside the lead hazard control area after the final visual inspection in the quantities and at the locations specified.

   (1) Near the building foundation 1 composite sample/building.

1.13.6 Waste Disposal Sampling

The Contractor shall sample the following waste streams for TCLP analysis to determine waste disposal requirements.

a. The Contractor shall take 1 TCLP samples of building demolition debris/per building..

b. The Contractor shall take 1 TCLP samples of paint chips/per building.

c. The Contractor shall take 1 compsite samples of soil.

1.13.7 Analytical Results

The Contractor shall develop and maintain during the course of the project a log of analytical results generated by the above sampling requirements. The log shall clearly describe the reason for which the sample was taken (worker exposure, migration control, clearance) the analytical result for each sample and evaluate if the analytical result passed or failed the action levels. At a minimum, the Contractor shall include analytical results for samples required to be taken in paragraphs Occupational Exposure Assessment, Lead Hazard Control Area/Containment Monitoring, Occupancy During Work, and Clearance Monitoring specified above.

1.14 CLEARANCE REQUIREMENTS

The Contractor shall describe clearance requirements for this project in the Clearance Plan Appendix of the Accident Prevention Plan.

a. Clearance levels inside lead hazard control area, public and commercial buildings:

(1) Floors 100.
(2) Bare soils 2000 mg/kg.

1.15 PERSONAL PROTECTIVE EQUIPMENT (PPE)

The Contractor shall describe the PPE to be used to protect workers from lead hazards in the Lead Hazard Control Plan Appendix of the Accident Prevention Plan. The Contractor shall furnish, at no cost to the workers, clothing for protection from lead-contaminated dust and debris. An adequate supply of these items shall be available for worker and Government personnel use. Protective clothing shall include:

a. Coveralls : Full-body moisture permeable (breathable)disposable coveralls shall be provided to lead hazard control workers.

b. Boots: Boots and shoes shall be provided as required by EM 385-1-1 Section 05.A.08 for workers. Boot/shoe covers shall be provided to prevent contamination of boots and shoes.

c. Hand Protection: Gloves, etc., shall be provided as required by EM 385-1-1 Section 05.A.10 for workers.

d. Head Protection: Hard hats shall be provided as required by 29 CFR 1910 (.135) and EM 385-1-1 Section 05.D for workers and authorized visitors.

e. Eye and Face Protection: Eye and face protection shall be provided as required by 29 CFR 1910 (.133) and EM 385-1-1 Section 05.B for workers and authorized visitors.

f. Respirators: NIOSH certified air-purifying respirators or filtering face pieces shall be provided for use as respiratory protection for airborne lead and for other hazardous airborne contaminants that may be encountered; as determine by the on-site safety and health supervisor. At a minimum, respirators shall be furnished to each employee required to enter a lead hazard control area where an employee exposure assessment has not yet been performed, or where monitoring data establishes the need for respiratory protection, or if requested by the employee.

g. Respirator Cartridges/Filtering Face Pieces: Respirator cartridges shall be changed out/filtering face pieces properly disposed of when the they become sufficiently loaded with particulate matter that workers experience breathing resistance. Cartridges and filtering face pieces shall be N, R or P 100 rated to assure sufficient protection from lead exposure.

## 1.16 HYGIENE FACILITIES

The Contractor shall describe the personal hygiene facilities to be used by the workers in the Lead Hazard Control Plan Appendix of the Accident Prevention Plan. The Contractor shall provide hygiene facilities for lead hazard control workers. Hygiene facilities shall consist of the following:

### 1.16.1 Hand Wash Stations

The Contractor shall provide hand washing facilities for use by lead hazard control workers. Hand washing facilities shall comply with the requirements in 29 CFR 1926 (.51) (f). Faces and hands shall be washed when leaving the lead hazard control area and after each work-shift if showers are not provided.

### 1.16.2 Change Area

The Contractor shall provide a change area to workers. The change area shall be equipped so that contaminated work clothing and street clothes shall be stored separately to prevent cross contamination.

### 1.16.3 Showers

Showers shall be provided if feasible and if worker exposures exceed the PEL. When provided, showers facilities shall meet the requirements of 29 CFR 1926 (.51) (f).

### 1.16.4 Eating Area

The Contractor shall set aside an area or provide a room for taking breaks and eating lunch. This area shall be kept as free as practicable from lead contamination. Workers shall be required to follow the procedures in 29 CFR 1926 (.62) (i)(4) when using the room.

## 1.17 POSTED WARNINGS AND NOTICES

The following regulations, warnings, and notices shall be posted at the worksite in accordance with 29 CFR 1926 (.62).

1.17.1 Regulations

At least two copies of 29 CFR 1926 (.62) shall be made available for use by either the Contracting Officer or affected workers; and for the purpose of providing required information and training to the workers involved in the project. One copy shall be maintained in the Contractor's jobsite file, and a second copy shall be posted where it will be accessible to workers on the site.

1.17.2 Warning Signs and Labels

Warning signs shall be posted in each lead hazard control area where worker exposure to lead is undetermined or where the exposures are above the permissible exposure limit as defined in 29 CFR 1926 (.62). Signs shall be located to allow personnel to read the signs and take necessary precautions before entering the lead hazard control area.

1.17.2.1 Warning Signs

Warning signs shall be in English be of sufficient size to be clearly legible, and display the following:

WARNING
LEAD WORK AREA
POISON
NO SMOKING OR EATING

1.17.2.2 Warning Labels

Warning labels shall be affixed to all lead waste disposal containers used to hold materials, debris and other products contaminated with lead hazards; warning labels shall be in English and be of sufficient size to be clearly legible, and display the following:

CAUTION: CLOTHING CONTAMINATED WITH LEAD. DO NOT REMOVE DUST BY

BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASH WATER IN

ACCORDANCE WITH APPLICABLE FEDERAL, STATE OR LOCAL REGULATIONS.

1.17.3 Worker Information

Right-to-know notices shall be placed in clearly visible areas accessible to personnel on the site, to comply with Federal, state, and local regulations.

1.17.4 Air Monitoring Results

Air monitoring results shall be prepared so as to be easily understood by the workers. One copy shall be maintained in the Contractor's jobsite file, and a second copy shall be posted where it will be accessible to the workers as specified in 29 CFR 1926 (.62).

1.17.5 Emergency Telephone Numbers

A list of emergency telephone numbers shall be posted at the site. The list shall include numbers of the local hospital, emergency squad, police and fire departments, Government and Contractor representatives who can be

reached 24 hours per day, and professional consultants directly involved in the project.

1.18 MATERIALS AND EQUIPMENT

Sufficient quantities of health and safety materials required by 29 CFR 1926 (.62), and other materials and equipment needed to complete the project, shall be available and kept on the site.

1.18.1 Abrasive Removal Equipment

The use of powered machine for vibrating, sanding, grinding, or abrasive blasting is prohibited unless equipped with local exhaust ventilation systems equipped with high efficiency particulate air (HEPA) filters.

1.18.2 Negative Air Pressure System

1.18.3 Vacuum Systems

Vacuum systems shall be suitably sized for the project, and filters shall be capable of trapping and retaining all mono-disperse particles as small as 0.3 micrometers at a minimum efficiency of 99.97 percent. Used filters that are being replaced shall be disposed in a proper manner.

1.19 EXPENDABLE SUPPLIES

1.19.1 Polyethylene Bags

Disposable bags shall be polyethylene plastic and shall be a minimum of 6 mils thick (4 mils thick if double bags are used) or any other thick plastic material shown to demonstrate at least equivalent performance; and shall be capable of being made leak-tight. Leak-tight means that solids, liquids or dust cannot escape or spill out.

1.19.2 Polyethylene Sheeting

Sheeting shall be polyethylene plastic with a minimum thickness of 6 mil, or any other thick plastic material shown to demonstrate at least equivalent performance; and shall be provided in the largest sheet size reasonably accommodated by the project to minimize the number of seams. Where the project location constitutes an out of the ordinary potential for fire, or where unusual fire hazards cannot be eliminated, flame-resistant polyethylene sheets which conform to the requirements of NFPA 701 shall be provided.

1.19.3 Tape and Adhesive Spray

Tape and adhesive shall be capable of sealing joints between polyethylene sheets and for attachment of polyethylene sheets to adjacent surfaces. After dry application, tape or adhesive shall retain adhesion when exposed to wet conditions, including amended water. Tape shall be minimum 2 inches wide, industrial strength.

1.19.4 Containers

When used, containers shall be leak-tight and shall be labeled in accordance with EPA, DOT and OSHA standards, as specified in paragraph WARNING LABELS.

1.20 STORAGE OF MATERIALS

Materials shall be stored protected from damage and contamination. Flammable or hazardous materials shall not be stored inside a building. Materials shall be regularly inspected to identify damaged or deteriorating items. Damaged or deteriorated items shall not be used and shall be removed from the site as soon as they are discovered. Stored materials shall not present a hazard or an inconvenience to workers, visitors, and/or other occupants and employees of the facility in which they are located.

PART 2 PRODUCTS (NOT APPLICABLE)

PART 3 EXECUTION

3.1 WORK PROCEDURES

The Contractor shall perform work following practices and procedures described accident prevention plan.

3.1.1 Lead Hazard Control Areas, Equipment and Procedures

The Contractor shall set up lead hazard control areas and operate equipment within the lead hazard control area in a manner that will minimize migration of lead dust beyond the lead hazard control area boundaries and minimize exposure to workers.

3.1.2 Lead Hazard Control Areas

Access into lead hazard control areas by the general public shall be prohibited. Workers entering the lead hazard control area shall meet medical surveillance requirements of this contract and shall be required to understand and follow procedures described in the Contractor's accident prevention plan for reducing lead exposure. Lead hazard control area preparation and restriction requirements follow:

a. Containment features for interior lead hazard control projects: Polyethylene sheeting sealed with spray adhesive and duct tape and Colored caution tape to designate the lead hazard control area. The floor in the lead hazard control area shall be covered with two layers of polyethylene sheeting. The entry/exit shall be sealed with a primitive air lock. Openings, such as HVAC supply and return air vents, into the lead hazard control area shall be sealed with polyethylene sheeting and duct tape or with sealed rigid coverings.

b. Containment features for exterior lead hazard control projects: Plastic sheeting, Colored caution tape, A roped-off boundary perimeter, using caution tape or a barrier installed at 25 feet distance from where the lead control work is performed.

3.2 USE OF HYGIENE FACILITIES

a. Personnel and equipment shall be decontaminated when exiting the lead hazard control area. The Contractor shall comply with the following personnel and equipment decontamination procedures:

(1) HEPA vacuum outer garments and equipment.
(2) Wet Wipe Equipment.
(3) Remover outer layer of garments.

(4) Thoroughly wash face and hands, if showering not required.
(5) Shower (if applicable).
(6) Remove Respirator (if applicable).
(7) Exit lead hazard control area.

b. The Contractor shall provide, and workers shall use, a change room to change into work clothing at the beginning of a work shift. At the end of the work shift workers shall change back into street clothing and leave contaminated work clothing at the site for disposal or laundering.

c. The Contractor shall provide an eating facility as free as practical from lead contamination. Workers shall be allowed usage of the eating facility for rest/lunch breaks.

## 3.3 WASTE DISPOSAL PROCEDURES

### 3.3.1 Construction Debris and/or Sanitary Landfill Waste

The Contractor shall dispose of the following waste streams in a construction debris, sanitary landfill: Building Demolition Debris, Used Personal Protective Equipment, Disposable material from containment structures.

### 3.3.2 Waste Stream Classification

Quad C is exempt from hazardous waste regulations since it is used as a military barracks. The landfill will require a profile (TCLP) on the demolition debris and paint chips collected for their records. If paint chips are collected, the landfill requests that the chips are double bagged in 6 mil poly bags.

### 3.3.3 RCRA Subtitle C Hazardous Waste

Since Quad c is a military barracks, it will be exempt from hazardous wasted disposal regulations. The waste from this project is considered residential waste. The landfill will require TCLP Tests, one for demo and paint chip debris for their records.

## 3.4 LEAD HAZARD CONTROL PROCEDURES, METHODS AND TECHNIQUES.

### 3.4.1 Paint Removal Methods

Prohibited paint removal methods shall include: open flame burning or torching, including the use of heat guns having operating temperatures greater than 1,100 degrees F; machine sanding or grinding without HEPA exhaust; non-contained hydro blasting or high-pressure water wash; abrasive blasting or sandblasting without HEPA exhaust; dry scraping, except near electrical outlets or when using a heat gun. Chemical paint removers containing methylene chloride are prohibited. Building components and structures adjacent to the removal process shall be appropriately protected from damage due to the removal process employed. Stripping shall be done according to manufacturer's recommendations. Stripped substrates shall be thoroughly washed and neutralized before applying a primer or sealing coat.

#### 3.4.1.1 Wet Scraping

Surfaces near electrical outlets shall not be moistened but shall be dry scraped only. Loose material shall be scraped from the surface and

deposited onto the containment plastic. Damp scrapings shall be cleaned up as soon as possible to prevent tracking throughout the work area. Scraper blades shall be kept sharp. Additional scraper blades shall be supplied and shall be selected for the type of surface being scraped.

## 3.5 CLEARANCE PROCEDURES

### 3.5.1 Visual Inspection

QSHP shall perform a visual inspection, using the form at the end of this section, for each lead hazard control area to assure that lead hazard control activities, identified in the individual work task data elements, have been properly completed. The QSHP shall visually verify that lead hazards have been removed, control technology has been appropriately applied/installed and that the lead hazard control area is free of dust and paint chips generated by lead hazard control activities.

### 3.5.2 Analytical Demonstration of Clearance

After the visual inspection the independent risk assessor shall take clearance samples for laboratory analysis to verify clearance requirements specified in paragraph CLEARANCE REQUIREMENTS have been met.

## 3.6 EVALUATION OF SAMPLING AND MONITORING RESULTS

Analytical results from samples taken during lead hazard control activities shall be evaluated to determine compliance with occupational safety and health standards and project specific control efficiency and clearance/clean up levels.

### 3.6.1 Occupational Safety and Health

The QSHP shall review the analytical results from samples taken for the initial exposure assessment and continued occupational safety and health monitoring if required. Effectiveness and adequacy of personal protective equipment, respirators, work practices, hygiene facilities and personal decontamination procedures shall be evaluated and upgrades/downgrades in equipment and procedures made. After notifying the Contracting Officer the following shall be applied:

a. Exposures over the PEL (0.05 mg/cubic meter):

(1) Improve work practices to reduce exposures.

(2) Don respirators.

(3) Assure eating facilities and change rooms are clean and are free from settled dust.

(4) Shower as part of personal decontamination.

b. Exposures over the Action Level (0.03 mg/cubic meter):

(1) Assure exposed individuals enrolled in the medical surveillance program.

(2) Assure exposed individuals enrolled in and up to date with lead exposure training requirements.

3.6.2 Control Efficiency of Containment Features

The QSHP shall review and document results of the visual inspection determining visual clearance criteria are being met while lead hazard control activities are being performed. The QSHP shall review analytical results from samples taken to determine if lead is migrating outside lead hazard control areas at levels in excess of clearance criteria. The QSHP shall notify the Contracting Officer and apply the following actions if results exceed project specific clearance levels outside the lead hazard control area:

a. Require/improve containment.

b. Improve work practices to reduce lead aerosol generation.

3.6.3 Clearance

The QSHP shall review analytical results for the samples taken to determine compliance with project specific clearance requirements. The following actions apply and shall be performed at the Contractor's expense if project specific clearance levels are exceeded:

Reclean surfaces.
Retest to determine clearance.

3.6.4 Removal of Lead Hazard Control Area

Upon acceptance of the final clearance certification by the Contracting Officer, and when authorized, cleared Lead Hazard Control Area boundary controls and warning signs shall be removed.

3.7 CLEARANCE REPORT

The QSHP shall prepare a clearance report including the following information:

a. Start and completion dates of lead hazard control activities.

b. Type of lead hazard control activity performed (i.e., abatement, interim control, renovation, remodeling), locations and lead hazards controlled or abated.

c. The name and address of each firm conducting lead hazard control activities and the name of each supervisor assigned to the project.

d. The Occupant Protection Plan prepared pursuant to paragraph OCCUPANT PROTECTION PLAN.

e. The name, address and signature of the QSHP or independent risk assessor to indicate clearance requirements have been met.

f. Certification of each Final Cleaning and Visual Inspection performed by the QSHP.

g. Analytical results from clearance sampling performed by the QSHP or independent risk assessor, the name of the laboratory that conducted the analysis. Results shall be provided in both the laboratory report and on the appropriate example forms provided at the end of this section.

h. A detailed written description of the lead hazard control activities performed, including hazard control methods used, locations of rooms and/or components where lead hazard control activities occurred, reason for selecting particular hazard control methods for each component, and any suggested monitoring of encapsulants or enclosures.

i. Waste disposal documentation.

j. Contractor provided installation/maintenance manuals.

3.8 TITLE TO MATERIALS

Materials resulting from demolition work, except as specified otherwise, shall be come the property of the Contractor, and shall be disposed of off Government Property.

3.9 PAYMENT FOR HAZARDOUS WASTE

Payment for disposal of hazardous waste will not be made until a signed copy of the manifest from the treatment or disposal facility certifying the amount of lead-containing materials delivered is returned and a copy is furnished to the Government.

3.10 CERTIFICATION OF VISUAL INSPECTION

Certify that the lead hazard control ares(s) for each individual work task data elements have passed visual clearance criteria and are ready for clearance sampling. To pass visual clearance, lead hazards have to be removed; control technology appropriately applied/installed; the lead hazard control area must be free from visible dust debris, paint chips or any other residue that may have been generated by the lead hazard control activities.

Signature by the QSHP indicates that the described lead hazard control area(s) have passed visual clearance criteria. Provide detailed description of each Lead Hazard Control Area.

## EXECUTIVE SUMMARY

Myounghee Noh & Associates, L.L.C. (MNA), under contractual agreement with the U.S. Army Honolulu Engineer District (HED), conducted a building inspection for hazardous materials at Quad C (Buildings 355, 356, 357, and 358), Schofield Barracks, Island of Oahu, Hawaii, in May 2002. The project is being completed for the HED under the Contract No. DACA83-02-P-0007 and is titled: Underground Storage Tank (UST), PCB Ballast Inspection for Buildings 355, 356, 357, and 358 (Quad C), Schofield Barracks, Oahu, Hawaii.

Quad C buildings were built during World War II and are planned for renovation as part of the Whole Barracks Renewal Brigade Complex, Phase 3A. The purpose of the survey was to identify the existence of the hazardous substances, such as PCBs and mercury, and heating oil tanks with associated piping, which may be disrupted during the renovation.

Myounghee Noh served as the project manager, and Edwin Boyette led a two-man field inspection team during the May 2002 survey. Miriam Koyanagi of HED provided the project oversight as the Government Technical Manager, and Capt. John Manion of the Army Directorate of Public Works (DPW) helped provide access to the units within Quad C.

During May 13 – June 1, 2002, MNA inventoried light fixtures, fluorescent light tubes, and light switches in 840 units (~92%) within Quad C but was not able to access 74 units (8%). A total of 2,444 light fixtures were inventoried of which 347 fixtures (14%) were opened and inspected. Seventeen light fixtures suspected of containing PCBs were found in Quad C: nine in Bldg 356 (units 116 & 180); seven in Bldg 357 (corridors 135 & 145, units 120A, 120B, & 158); and one in Bldg 358 (unit 116).

The total number of fluorescent light tubes suspected of containing mercury is estimated to be 6,006 in Quad C: 1,116 in Bldg 355; 1,362 in Bldg 356; 1,931 in Bldg 357; and 1,597 in Bldg 358. Due to inaccessibility of the 74 units, MNA made estimates for the number of light fixtures and light tubes in those units. No light switches suspected of containing mercury were found. The survey results are presented in Table 1 and Appendix B.

A visual inspection of the boiler rooms and vicinity was conducted. The boiler systems previously utilized fuel oil burning system had been replaced by propane burner systems. All connections of fuel oil piping were found disconnected and removed from the boiler rooms except for those in Bldg 358 (Photographs in Appendix A).

According to a review of plans obtained from the Army Directorate of Public Works (DPW), the four fuel oil tanks were to be closed during a project entitled: Remove/Replace UST System (Quad C, Bldgs 355, 356, 357, & 358), Schofield Barracks, Oahu, Hawaii (E-94-59). The DPW plan specified that the USTs were to be closed in accordance with the Hawaii Department of Health (DOH) UST Technical Guidance Manual; however, no closure reports were obtained for review. MNA recommends a review of the UST contractor submittals and notification to the DOH for permanent closures.

## 1.0 INTRODUCTION

Myounghee Noh & Associates, L.L.C. (MNA), under contractual agreement with the U.S. Army Honolulu Engineer District (HED), conducted a building inspection for hazardous materials at Quad C (Buildings 355, 356, 357, and 358), Schofield Barracks, Island of Oahu, Hawaii. The underground storage tank (UST), polychlorinated biphenyls (PCBs) ballast, and mercury lamp & light switch survey is being completed for the HED under the Contract No. DACA83-02-P-0007.

Quad C buildings were built during World War II and are planned for renovation as part of the Whole Barracks Renewal Brigade Complex, Phase 3A. The purpose of the survey was to identify the existence of the hazardous substances, such as PCBs and mercury, and heating oil tanks with associated piping, which may be disrupted during the renovation.

Myounghee Noh served as the project manager, and Edwin Boyette led a two-man field inspection team during the May 13 - June 1, 2002, survey. Miriam Koyanagi of HED provided the project oversight as the Government Technical Manager, and Capt. John Manion of the Army Directorate of Public Works (DPW) helped provide access to the units within Quad C.

## 2.0 BUILDING INSPECTION

Prior to the initiation of the fieldwork, floor plans of Buildings 355, 356, 357, and 358 were obtained from DPW and reviewed for planning. Each floor was split into sections based on the locations of the interior firewalls or other dividing points. The sequence of inspection was as follows:

- Upon entering each section, the Inspector and Inspector Technician surveyed the area for evident health and safety concerns such as broken fluorescent bulbs, exposed wiring, leaking dielectric fluid from ballasts, slips, trips, and/or falls hazards, and other general safety issues.
- Inventoried the fluorescent light fixtures and bulbs in individual rooms and common areas for PCB and mercury content.
- Randomly selected fluorescent fixtures for inspection (min. 10% planned).
- (First floor only) Checked light switches for mercury content.
- Inspected boiler room and its vicinity for evidence of fuel supply piping, vent lines, and fuel tanks.

Included in this section is a description of the field methodology employed in the survey.

### *2.1 PCB Ballast Inspection*

The number of fluorescent light fixtures in the rooms and common areas was recorded, and the fixtures to be inspected were selected. A minimum of 10% of the fixtures per floor section was inspected. Locked areas were noted on the floor plan. The Inspector Technician confirmed that the light switch was off, the fixture was opened, ballast cover plate removed, and the ballast label was reviewed to identify the "No PCBs" label. Ballasts that were not labeled "No PCBs" were assumed to contain PCBs. The location of the inspected fixtures with the make and type of ballast was noted on a sketch of the sampled room or area. The fixture was reassembled following inspection.

A second walk-through of the accessible areas was conducted following compilation of the data set into figures and tables as a quality assurance/quality control (QA/QC) to confirm the accuracy of the field data.

### *2.2 Mercury Containing Fluorescent Bulb Inspection*

The manufacturer and trade name of the bulb types in the inspected fixtures were noted during the PCB ballast inspection. Based on review of manufacturer's product information, all fluorescent lamps were assumed to contain mercury. During a subsequent walk-through, concurrently with the PCB ballast inspection, a QA/QC review was conducted to confirm the number of fluorescent bulbs per floor section.

### *2.3 Mercury Containing Light Switches*

Review of the manufacturer and historical information regarding the types of light switches indicated that mercury-containing switches are referred as "silent switches." The light switch inspection was limited to the first floor of each building, based on the information obtained during the pre-inspection meeting with the Government Technical Manager.

All accessible switches were sampled and the results noted on the floor plan. Each accessible switch was activated, and if an audible "click" or mechanical contact noise was noted, it was labeled as a contact switch. If switch activation did not produce an audible contact noise, the cover plate was removed and the switch surface was surveyed for the word "top" which would indicate that mercury was used in the mechanism. The cover plates were reinstalled following inspection.

### *2.4 UST Inspection*

A visual inspection of each boiler room and its vicinity was conducted to identify existing fuel storage tank, fuel supply piping, vent pipes, and possible indications of tank removals. The State of Hawaii Department of Health, UST Section, was consulted to confirm the registration status of four fuel storage tanks. Boiler tanks are exempt from the UST system upgrade requirements of 40 CFR 280 and are typically considered to be unregulated.

## 3.0 FINDINGS

### *3.1 PCB Ballasts*

A total of 2,444 light fixtures were inventoried, and 347 fixtures were opened up for inspection (14%); however, MNA was not able to access 74 units in Quad C due to unavailability of keys. Seventeen light fixtures suspected of containing PCBs were found in Quad C:

- Nine in Bldg 356 - units 116 & 180
- Seven in Bldg 357 - corridors 135 & 145, units 120A, 120B, & 158)
- One in Bldg 358 - unit 116

Based on the inspection findings, MNA estimates that there are no light fixtures suspected of containing PCBs in those inaccessible units on the 2nd and 3rd floors; however, if the 1st floor light fixtures are not labeled with "Rainbow Electric," they may contain PCBs. A summary of the survey is presented in Table 1, and a spreadsheet containing the field data is provided in Appendix A.

### *3.2 Mercury-containing Fluorescent Tubes*

A total of 5,561 fluorescent light tubes were counted from 914 units in Quad C. Due to the 74 (approximately 8%) inaccessible units, MNA made an assumption for the number of light tubes in those inaccessible units. The total number of light tubes estimated is 6,006 (Table 1 & Appendix A).

**Table 1. Summary of Quad C Light Fixtures and Switch Information**

| | Bldg 355 | Bldg 356 | Bldg 357 | Bldg 358 | Total |
|---|---|---|---|---|---|
| Total no. rooms | 195 | 245 | 235 | 243 | **918** |
| No. of inaccessible rooms | 8 | 10 | 26 | 30 | **74** |
| Percent room completed | 96% | 96% | 89% | 88% | **92%** |
| Light fixtures inventoried | 506 | 595 | 678 | 665 | **2,444** |
| Light fixtures inspected | 89 | 88 | 81 | 89 | **347** |
| PCB-suspect light fixtures | 0 | 9 | 7 | 1 | **17** |
| Light tubes counted | 1,086 | 1,327 | 1,751 | 1,397 | **5,561** |
| Additional fluorescent tubes estimated* | 30 | 35 | 180 | 200 | **445** |
| Total fluorescent tubes estimated * | 1,116 | 1,362 | 1,931 | 1,597 | **6,006** |
| Mercury-suspect light switches | 0 | 0 | 0 | 0 | **0** |

*Assumption was made due to the inaccessible units.

### *3.3 Mercury-containing Light Switches*

One hundred percent of accessible light switches were tested; however, no light switches suspected of containing mercury were found.

### *3.4 USTs*

No active connections of fuel oil supply and return piping in the boiler rooms were observed in the four Quad C buildings. The boiler systems previously utilized for the fuel oil burning system had been replaced by propane burner systems. Review of plans obtained from DPW indicated that the four tanks were to be closed during a project entitled: Remove/Replace UST System (Quad C, BLDGS 355, 356, 357, & 358), Schofield Barracks, Oahu, Hawaii (E-94-59).

All connections of fuel piping were found disconnected and removed from the boiler room except for those in Bldg 358 (Photographs 1-13 in Appendix A). The fuel oil supply and return piping of Bldg 358 had not been removed from the room (Photograph 11). The piping was observed to run from the pavement surface through the outside of the boiler room wall. A repair was observed on the pavement running from the boiler room wall to the reported location of the fuel UST. The repair appeared to be old and the repair joint was not sawcut as is the modern practice, which may indicate that the piping remains in place (Photograph 13). The vent line was cut approximately five inches above the pavement surface (Photograph 13). A summary of the findings is presented in Table 2.

## 4.0 LIMITATIONS

Every reasonable effort was made to identify suspect PCB- and mercury-containing materials and USTs during the survey of the subject buildings. However, this does not imply a guarantee that all possible sources of hazardous substance were identified by this assessment, because certain building materials and/or surfaces may be hidden by walls, flooring, partitions, etc. When suspect materials previously hidden by building components are uncovered, additional survey may be required prior to renovation or abatement.

## 5.0 RECOMMENDATIONS

The four boiler USTs remain registered with the State of Hawaii DOH. MNA recommends submittal of the UST closure documentations to DOH for proper record keeping.

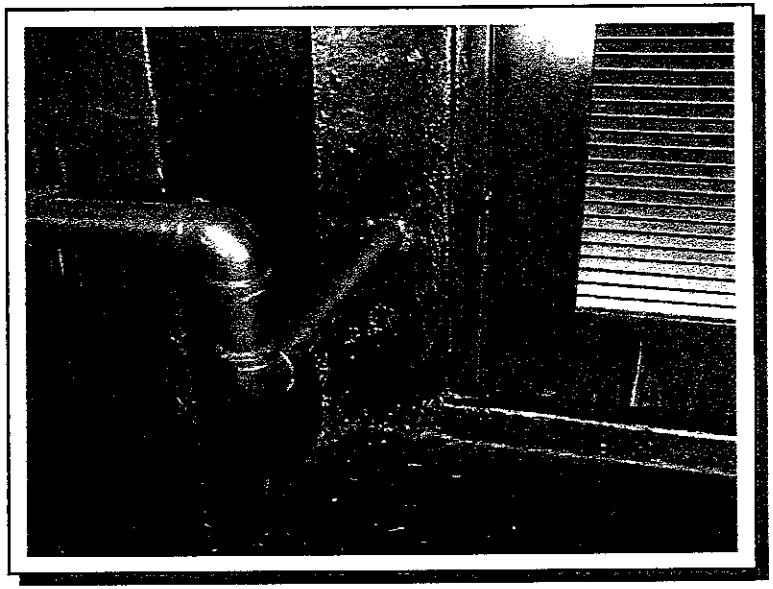
**Table 2. Summary of Quad C Former UST Information**

| Quad C Building | Source of Information | Findings |
|---|---|---|
| All | DOH UST registration | USTs for all four buildings are currently registered. |
| All | Project Plans (E-94-59), Sheets C-2, C-3, and M-1 | USTs were to be removed from service, piping systems disconnected, and soil samples collected and tested for UST closure. |
| 355 | Field verification | • Fuel oil piping disconnected from boiler room.<br>• Pavement above the UST is cut and repaired in typical method for in-place UST closure.<br>• Observation is consistent with demolition plans and notes. |
| 356 | Field verification | • Fuel oil piping is disconnected from boiler room. The fuel oil piping and vent line may be in place under the sidewalk.<br>• Concrete encasements which were shown on the site plans to incorporate the check valve and fill port were not evident. |
| 357 | Field verification | • Fuel oil piping is disconnected from boiler room and was not cut adjacent to the bldg wall. The vent line remains in place.<br>• Concrete encasements which were shown on the site plans to incorporate the check valve and fill port were not evident. |
| 358 | Field verification | • Fuel oil piping is disconnected from boiler room. The fuel oil piping and vent line may be in place under the sidewalk.<br>• Concrete encasements which were shown on the site plans to incorporate the check valve and fill port were not evident.<br>• A concrete cover or slab was present near the referenced location of the UST. |

# APPENDIX A

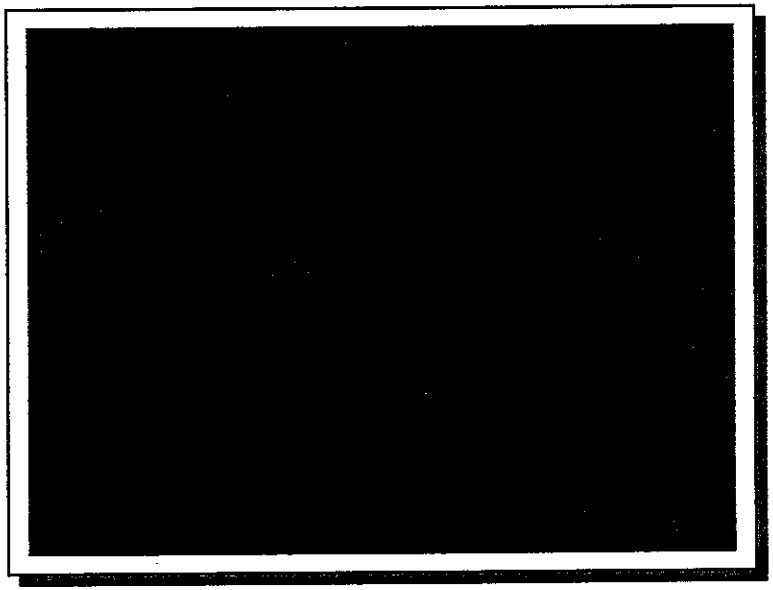
## UST Photographs

Photograph 1. A view of sawcuts in the pavement outside Bldg 355 boiler rm. The UST fill port remains in the pavement (5/27/02).

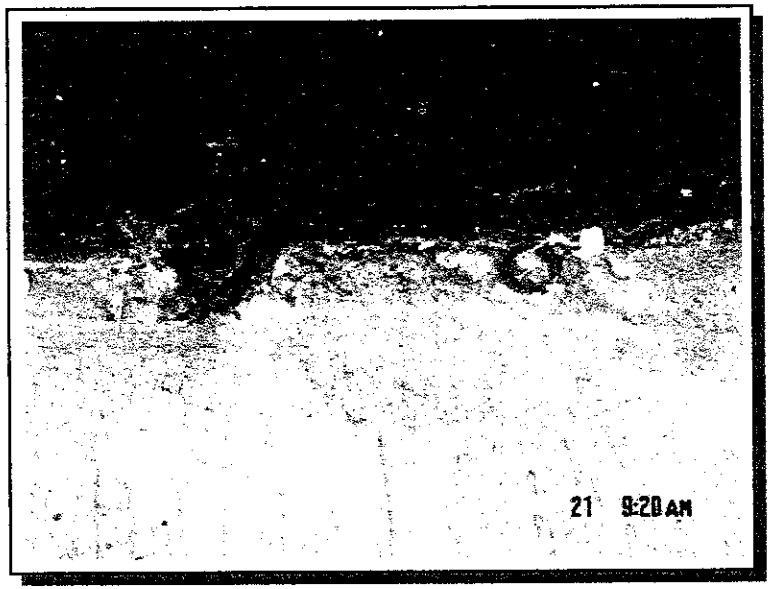


Photograph 2. Piping outside Bldg 355 boiler room. One of the penetrations is sealed and the other used for the propane piping (5/27/02).

Photograph 3. A view of the former UST vent pipe outside Bldg 355 boiler room (5/27/02).



Photograph 4. Bldg 356 boiler room. One of the penetrations is sealed and the other used for the propane piping (5/21/02)

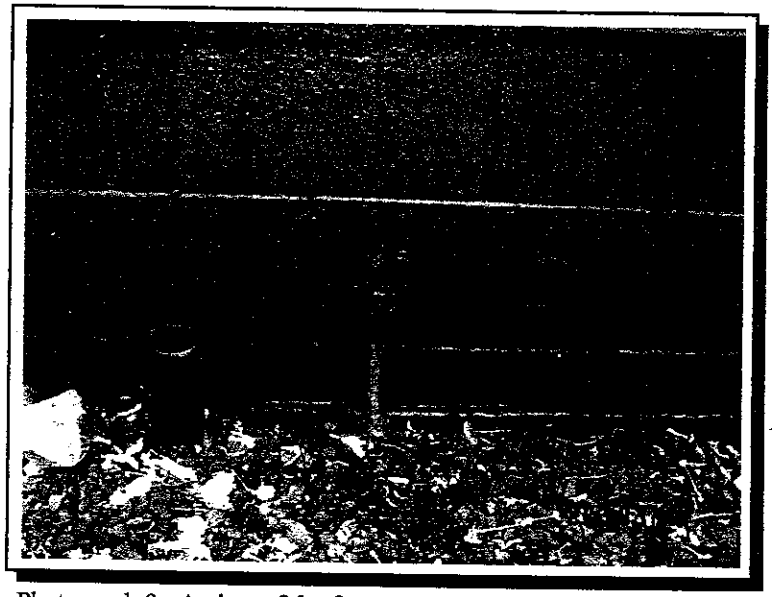


Photograph 5. Former fuel piping cut above the pavement surface outside Bldg 356 boiler room (5/21/02).

Photograph 6. A view of the former vent pipe and wall penetration outside Bldg 356 (5/21/02).

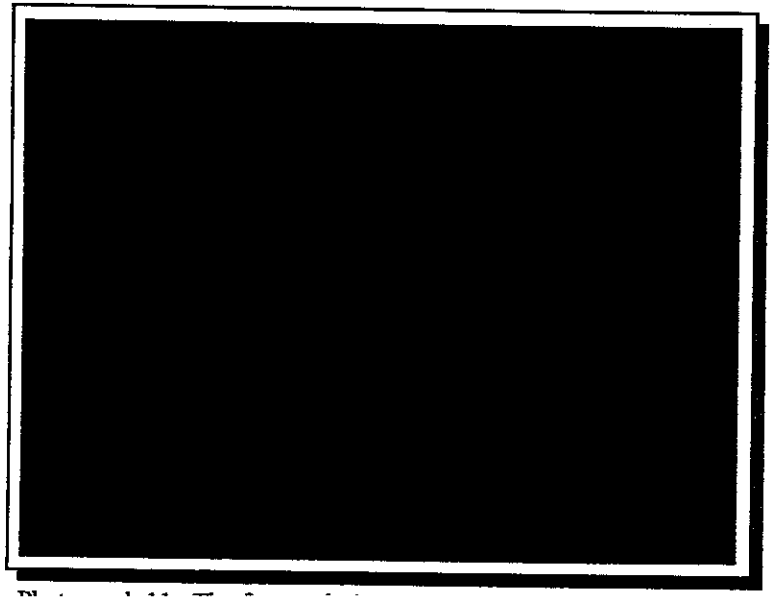
Photograph 7. Approx. location of the former UST at Bldg 356. The vent pipe and wall penetration is shown in background (5/21/02).

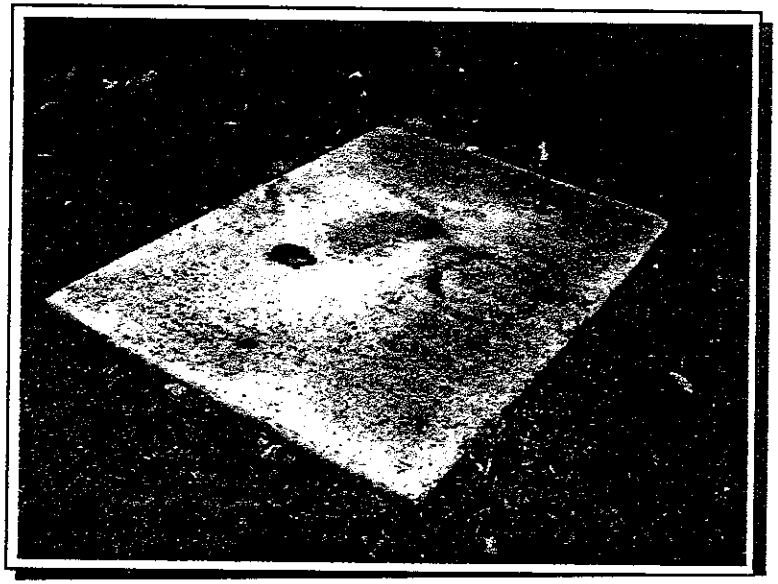
Photograph 8. A view of the Bldg 357 boiler room. Both wall penetrations were sealed (5/21/02).

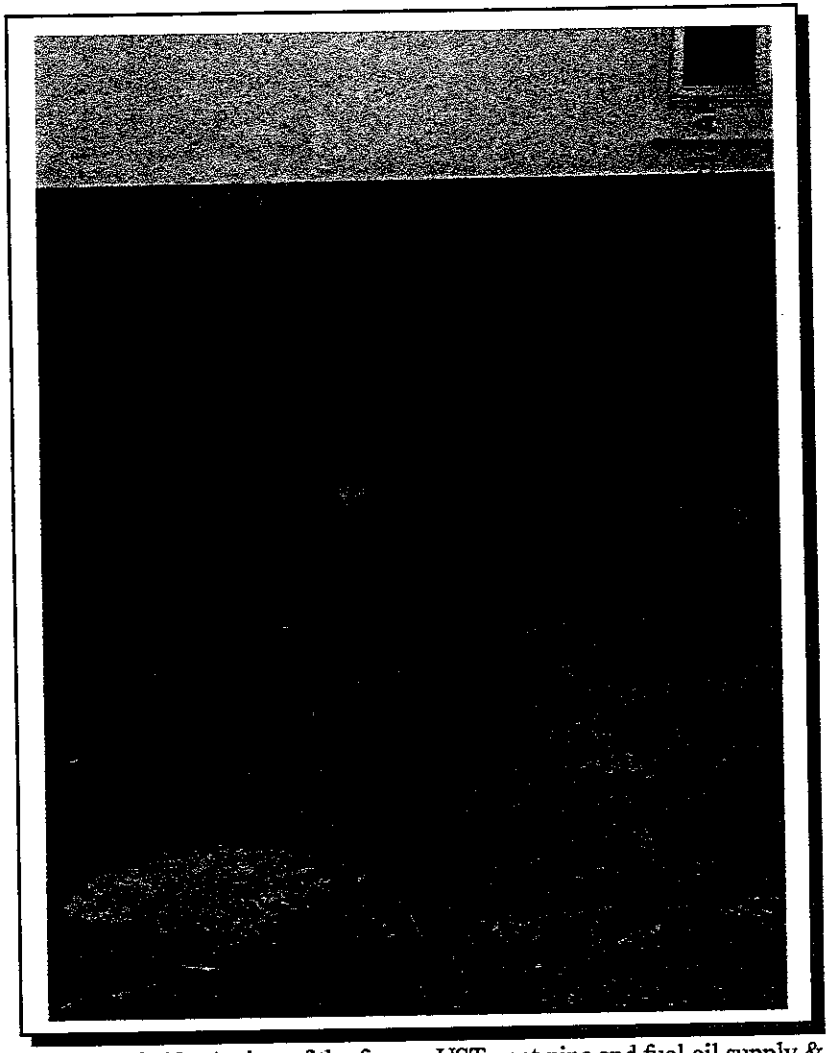


Photograph 9. A view of the former vent pipe and sealed penetrations at Bldg 357 boiler room (5/21/02).

Photograph 10. Approximate location of the former UST at Bldg 357 (5/21/02).







Photograph 13. A view of the former UST vent pipe and fuel oil supply & return piping outside Bldg 358 boiler room. The vent pipe had been cut but did not appear to be sealed. The area of repaired concrete agreed with the piping locations shown on the demolition plan (5/21/02).

**Contract DACA83-01-D-0017**
**Task Order #0001**

**March 2003**

# PREFACE

These two volumes contain the asbestos reinspection reports for Quad C at Schofield Barracks. Quad C consists of Buildings 355, 356, 357, and 358. The asbestos reinspections were performed by Soil and Land Use Technology, Inc. under Task 0001 of Contract #DACA83-01-D-0017. The reinspections were performed between November 30, 2001 and March 12, 2002.

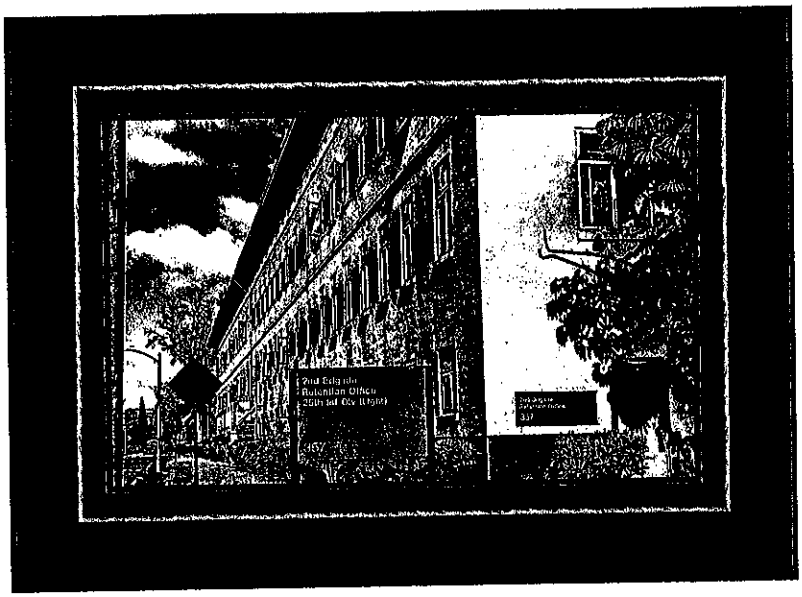
The following information is provided in each report:

- ❑ Name and location of the building inspected
- ❑ Date the inspection was performed
- ❑ Names of the certified inspectors who conducted the inspection
- ❑ Summary tables describing the type, location, condition, and quantity of identified asbestos containing materials
- ❑ Discussion of findings and recommendations
- ❑ Photographs of all identified asbestos containing materials
- ❑ Building drawings in Microstation® format, with sample numbers and locations of asbestos-containing materials indicated
- ❑ Laboratory sample analysis results and chain of custody documents for each sample collected from the building

Following the building inspection reports are the Sampling and Analysis Plan (SAP) for Task 0001 and certifications of the inspectors and analytical laboratories that participated in the surveys. The SAP details the methodology used in performing the inspections, including discussion of applicable regulations and sampling protocols. The certifications include the following:

- ❑ Asbestos Hazard Emergency Response Act (AHERA) Inspector certificates
- ❑ State of Hawai'i Inspector cards
- ❑ National Voluntary Laboratory Accreditation Program (NVLAP) certificates and State of Hawai'i certification letters for analytical laboratories

# Schofield Barracks



# Building 357

# Executive Summary

Soil and Land Use Technology, Inc. (SaLUT) performed an asbestos identification and assessment reinspection of Building 357 located at Schofield Barracks, Hawaii. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 357 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included to the extent that the suspect materials found in those surveys could be identified. The survey was conducted by SaLUT in accordance with the U.S. Army Corps of Engineers Honolulu Engineer District Scope of Work dated September 18, 2001. The survey was conducted December 11, 2001 through February 19, 2002.

All accessible areas of the building were inspected for suspect asbestos-containing building materials (ACBMs). One hundred and sixty samples of suspect asbestos containing material were collected. Analytical results confirmed that asbestos is present as floor tile, floor tile mastic, and caulking. A summary of the ACBMs encountered is provided on the next page. This report provides a detailed description of the ACBM locations, quantities, and hazard assessments based on conditions existing at the time of the inspection. No areas were found to contain ACBM causing high or imminent exposure potential.

# 1 Introduction

SaLUT performed an inspection of Building 357 to identify and assess all accessible ACBMs. This was a reinspection conducted at various times between December 11, 2001 and February 19, 2002 in accordance with the requirements outlined in the Scope of Work dated September 18, 2001. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 357 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included.

The following is a description of the building:

| | |
|---|---|
| **Function** | Barracks |
| **Size** | 90,000 square feet; three floors |
| **Foundation** | Concrete |
| **Exterior walls** | Concrete masonry units with plaster coating |
| **Roof** | Metal |
| **Mechanical systems** | Main mechanical room containing furnace and boiler on First Floor; secondary mechanical rooms on Second and Third Floors; pipes are insulated with fiberglass, rubber, and foam |
| **Climate control** | Central heating system; individual room air conditioning units; ducts are insulated with fiberglass |
| **Interior walls** | Concrete masonry units, drywall, plaster |
| **Floors** | Floor tile, concrete, ceramic tile, carpet |
| **Ceilings** | Ceiling tiles; fixed ceilings with ceiling plaster in some spaces |

Survey and assessment protocols were based on those adopted by the U.S. Environmental Protection Agency (EPA) as detailed in the Asbestos Hazard Emergency Response Act (AHERA; 40 CFR 763, Subpart E), and those of the Hawaii Department of Health in Hawaii Administrative Rule (HAR) 11-502 *Asbestos-Containing Materials in Schools.* In addition to identifying materials considered suspect by AHERA survey protocols, accessible roofing and other exterior materials were also addressed. SaLUT's inspectors identified and sampled all materials considered to be suspect under the regulations and other documents listed in Section 2 *Applicable Documents,* as well as those materials that have been found through other available literature and inspectors' experience (e.g., leveling paper and silver exterior paint) to potentially contain asbestos. This report does not address those suspect materials that would be expected in the building (e.g., sink undercoating in bathrooms of a residence)but were not encountered; the reader should assume that, if a suspect material is not mentioned in Section 3 *Findings,* the material was not found in the building.

For the following reasons, SaLUT's survey differed from a normal reinspection, wherein the locations and conditions of previously identified ACBMs are verified, and the impacts of building renovations are determined:

- **Inability to identify the Baker survey's homogeneous materials with certainty.** Photographs of the positive materials were not included in the Baker inspection report available at the Directorate of Public Works (DPW). Many of the types of floor tile in the original survey were described by their predominant color only. Other types of floor tile appear to have received more than one description (possibly due to having been described by different inspectors).

- **Multiple layers of floor tile.** Many rooms had multiple layers of floor tile. Numerous instances were identified where floor tile located in the 1993 survey had been covered by other types of tile. This made it impractical to carry out the following tasks with completed accuracy:
  - Verify all locations of floor tiles identified in the original survey
  - Quantify types of floor tile
  - Identify all types of floor tile in the building (it was assumed that all types of floor tile were visible in at least one location)

To deal with these issues, under the direction of SaLUT's Project Manager and Principal Investigator, the inspectors modified the survey protocol as follows:

- **Floor tile.** Where a floor tile type could be sampled by SaLUT's inspectors without causing unacceptable damage, the original inspection was ignored, the floor tile was given a SaLUT homogeneous material identification, and the floor tile was sampled in accordance with the SAP. If the material could be equated to a type of Baker floor tile, this was noted. Where older types of floor tile were noted below SaLUT's samples, but the older materials could not be sampled, the floor tile and associated mastic were identified from the material locations in Baker's report. Quantities of asbestos-containing floor tile and associated floor tile mastic below the top layer of floor tile were assumed to extend throughout the entire room.

- **Other materials identified in previous inspections.** For all other materials (including those that were determined to not contain asbestos) that had been identified in the previous inspections, SaLUT's inspectors attempted to locate the materials. In a number of cases, the materials had been abated during various renovation projects.

  The DPW survey identified two positive materials (thermal system insulation on a 4" diameter pipe in Rooms 100, 103, 108, 110, 120, 260, 366, and thermal system insulation on a 6" pipe in Rooms 105, 108, 119) not identified in the Baker survey. No photograph of this positive material was included in the inspection report. SaLUT's inspectors were unable to locate this material. It is possible that the material was abated.

- **Other materials not identified in previous inspection.** SaLUT's inspectors identified and sampled a number of suspect materials (e.g., types of caulking) that were not identified previously.

- Ceiling Tile. A number of samples were taken by SaLUT to confirm Baker's results that all no ceiling tiles contained asbestos. At that point, SaLUT stopped sampling ceiling tile and Baker's inspection results were accepted.

All samples were collected in accordance with the Sampling and Analysis Plan (SAP) for the task except as noted above. Where applicable, corners of wall-to-wall carpeting were lifted to examine flooring materials under the carpet. Metal roofs that would not support the inspector's weight were examined visually; if suspect materials were identified they were presumed to contain asbestos unless they could be sampled from an accessible edge of the roof. These situations, as well as other special situations, are discussed in the SAP located in Appendix A of this volume.

On-site inspection and assessments were conducted by John Willard, Kenneth Reynolds, and John Veitch, EPA and State of Hawai'i accredited Asbestos Inspectors. Quality control review was conducted by Dr. David M. Heisler (Principal Investigator).

# 3 Findings

Fifty-five homogeneous materials suspected of potentially containing asbestos were identified and sampled by SaLUT. SaLUT also identified, but did not sample, an additional eight types of floor tile and mastic that were found to be ACBM by Baker. SaLUT collected 160 bulk asbestos samples that were analyzed by White Environmental Consultants, Inc. and Globeteck at their National Voluntary Laboratory Accreditation Program (NVLAP) - accredited laboratories in Honolulu using polarized light microscopy/dispersion staining (PLM/DS) techniques. For some homogeneous materials, the laboratories used a *stop on positive* procedures whereby if one sample was confirmed as ACBM, the remaining samples were not analyzed. Composite samples of floor tile and floor tile mastic were split and the two components were analyzed individually as required by AHERA regulations. Therefore, the number of samples collected differs from the number analyzed. SaLUT submitted duplicates of 15 of the samples analyzed by White to Globeteck, and one sample analyzed by Globeteck to White, for quality control analysis. Two floor tile samples that were analyzed by White to be non-asbestos-containing (B15 and B46) were found by Globeteck to be ACBM. Three samples of caulking that were analyzed by PLM as being non-asbestos-containing were found to be ACBM when reanalyzed by transmission electron microscopy (TEM) by EMSL, Inc., a third NVLAP-accredited laboratory.

As a result of these laboratory analyses, 13 homogeneous materials (two types of floor tile, 10 types of floor tile mastic, and caulking) were confirmed as ACBM by sample analysis, in addition to the 8 types of asbestos-containing floor tile and floor tile mastic identified by Baker and remaining in the building. The condition of the encountered positive materials was good, although some floor tiles are broken. Photographs 4 through 12 illustrate the ACBMs sampled by SaLUT. SaLUT was unable to photograph the ACBMs identified by Baker because they located below underneath floor tile sampled by SaLUT and were only revealed in the small areas where SaLUT's samples were taken.

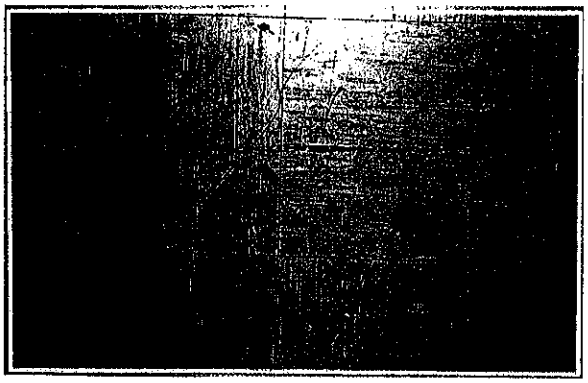
Baker indicated that plaster on the exteriors of various floors of three Quad C buildings was ACBM. Anecdotal evidence from various sources mentions occasional plaster samples from the exteriors of Quad buildings that were ACBM. However, As was the case for SaLUT's plaster samples, all of Baker's plaster samples (including interior plaster) from Quad C contained either no asbestos or less than 1 percent asbestos. Therefore, under AHERA and SaLUT's SAP, none of the plaster is ACBM.

All identified homogeneous materials considered to be potentially asbestos containing ("suspect") are listed on the *Homogeneous Materials Listing* (Table 1). These materials are grouped according to class (i.e., miscellaneous, surfacing, and thermal system insulation) and floor of the building. For each suspect material, the friability, general locations in the building, and sample numbers are indicated, as well as whether the material was determined to be ACBM or not. Red sample numbers indicate those samples that contained asbestos. Gray sample numbers indicate samples that were not analyzed because another sample of the same material contained asbestos. Suspect materials identified as ACBM by quality control analysis are identified by an asterisk (*) following the appropriate sample number. The ACBMs identified by Baker and not sampled by SaLUT are listed following SaLUT's homogeneous materials.

Sample collection sites for identified suspect ACBMs, as well as locations of identified ACBMs, are indicated on the building drawings (Figure 1).

Table 2, *Summary of Asbestos-Containing Materials,* provides a summary of the encountered ACBMs in the building. Each material is listed with information regarding the type, location, and condition of the ACBM, along with the recommended response action for the material.

Laboratory analysis sheets for all samples collected by SaLUT, including the quality control analyses, are located at the end of this report. The TEM analysis results are located at the end of the laboratory results.



*Photograph 4. FT2. This floor tile (FT2) contains asbestos. The mastic below it (FM2) does not.*

# 4 Recommendations

Each friable ACBM was assessed and placed in the appropriate AHERA category as specified in 40 CFR, Part 763.88. In addition to the seven AHERA assessment categories, SaLUT added an eighth category for all non-friable ACBM.

SaLUT also categorized the condition of each ACBM at the time of the survey, as follows:

**Good** No damage observed

**Fair** The area of distributed damage was less than 10 percent and greater than 2 percent. The area of localized damage was less than 25 percent and greater than 2 percent.

**Poor** The area of distributed damage was greater than 10 percent and the localized damage was greater than 25 percent.

Based on the AHERA assessment category and SaLUT's condition assessment, SaLUT recommends on or more of the following response actions for each ACBM:

**O&M** Maintain the ACBM. Perform operations and maintenance procedures in a manner that does not damage the material. These procedures are specified in 29 CFR 1926.1101 and HAR 11-502-10. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

**Repair** Damaged areas should be repaired. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

Undamaged and repaired materials are subject to the O&M response action.

**Remove** The material should be removed. Removal must be performed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

If the building is demolished or renovation will impact any ACBMs, those materials must be removed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

Table 2 provides the AHERA assessment category, SaLUT's condition assessment, and SaLUT's recommended response action for each ACBM.

**Table 2. Summary of Asbestos-Containing Materials.**

| Material Description | Location | Quantity | Friable | Cond. Assess. | AHERA Assess. Cat. | Recommended Response Action | Photo Ref. |
|---|---|---|---|---|---|---|---|
| **First Floor** | | | | | | | |
| FM11 Black mastic | Rooms 105, 115, 116, 118, 120, 125; hallway outside Room 120A | 4,320 sf | No | Good | 8 | O&M | 10 |
| FM14 Black mastic | Rooms 122, 128-130, 132, 133 | 2,134 sf | No | Good | 8 | O&M | 5 |
| FM15 Black mastic | Room 125 | 151 sf | No | Good | 8 | O&M | 12 |
| FT2 12" x 12" cream floor tile with brown streaks | Rooms 106-108, 115-118, 125, 143, 144 | 5,728 sf | No | Good | 8 | O&M | 4 |
| M038 12 x 12 floor tile cream | Rooms 134, 141, 146-152, 154 | 1,643 sf | No | Good | 8 | O&M | None |
| M039 Flooring adhesive black | Below M038 | 1,643 sf | No | Good | 8 | O&M | None |
| M043 12 x 12 floor tile olive | Rooms 126, 130, 135, 145, 153, 155 | 1,253 sf | No | Good | 8 | O&M | None |
| M044 Flooring adhesive black | Below M043 | 1,253 sf | No | Good | 8 | O&M | None |
| M049 12 x 12 floor tile rust | Room 143 | 798 sf | No | Good | 8 | O&M | None |
| M050 Flooring adhesive black | Below M049 | 798 sf | No | Good | 8 | O&M | None |
| M059 12 x 12 floor tile dark beige | Rooms 122, 131 | 6 sf | No | Good | 8 | O&M | None |
| M060 Flooring adhesive black | Below M059 | 6 sf | No | Good | 8 | O&M | None |
| **Second Floor** | | | | | | | |
| FM7 Black mastic | Below FT7 (all rooms and hallways except Rooms 218, 221, 256, 259, 261) | 13,923 sf | No | Good | 8 | O&M | 5 |
| FM10 Black mastic | Room 259 | 48 sf | No | Good | 8 | O&M | 9 |
| FT10 12"x12" olive floor tile (painted black) | Room 259 | 48 sf | No | Good | 8 | O&M | 9 |
| **Third Floor** | | | | | | | |
| FM3 Black/amber mastic | Below FT3 (all rooms and hallways except 318, 321, 356, 361-363, 367, 369) | 16,023 sf | No | Good | 8 | O&M | 5 |
| FM4 Black/brown mastic | Room 369 | 4 sf | No | Good | 8 | O&M | 7 |
| FM5 Black mastic | Room 369 | 184 sf | No | Good | 8 | O&M | 6 |
| FM6 Black mastic | Rooms 362, 363 | 640 sf | No | Good | 8 | O&M | 8 |
| FM13 Black mastic | Room 367 | 184 sf | No | Good | 8 | O&M | 11 |
| **Roof** | | | | | | | |
| CK1 Caulking | Exterior; off fan outlets; first floor; dining hall vents | 10 lf | No | Good | 8 | O&M | 13 |

Table 3 provides SaLUT's cost estimate for abating (i.e., removing) each ACBM identified in the building. These estimates are conceptual cost estimates based on standard unit rates for different types of ACBM except for very small abatement projects, where the minimum cost is $1,200. Contractor mobilization/demobilization, transportation, disposal, and other miscellaneous costs are included in the unit. Operations and maintenance (O&M) costs are not provided as part of the recommended response cost.

**Table 3. Asbestos Abatement Cost Estimates.**

| Material Type | | Location | Quantity | Unit Cost ($) | Total Removal Cost |
|---|---|---|---|---|---|
| | | First Floor | | | |
| FM11 | Black mastic | Rooms 105, 115, 116, 118, 120, 125; hallway outside Room 120A | 4,320 sf | 3 | $12,960 |
| FM14 | Black mastic | Rooms 122, 128-130, 132, 133 | 2,134 sf | 3 | 6,402 |
| FM15 | Black mastic | Room 125 | 151 sf | 3 | 453 |
| FT2 | 12" x 12" cream floor tile with brown streaks | Rooms 106-108, 115-118, 125, 143, 144 | 5,728 sf | 5 | 28,640 |
| M038 | 12 x 12 floor tile cream | Rooms 134, 141, 146-152, 154 | 1,643 sf | 5 | 8,215 |
| M039 | Flooring adhesive black | Below M038 | 1,643 sf | 3 | 4,929 |
| M043 | 12 x 12 floor tile olive | Rooms 126, 130, 135, 145, 153, 155 | 1,253 sf | 5 | 6,265 |

Comments:

**Analyst** _____ **Date** 12/27/01
**QC** _____ **Date** 12/21/01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Attn: Tina Perry

**RE: Revision to PLM sample results for sample numbers 121101-357-JMV-B77 thru B79**

Dear, Mrs. Tina Perry

On 12/17/01 Shad Wells analyzed samples from Bldg. 357 Scholfield Barracks. Sample 121101-357-JMV-B77 thru B79 had a fibrous material present in the second layer of caulking material that had the morphology of tremolite asbestos. The material was mounted in a refractive index oil of 1.605. The fibers produced dispersion staining colors not normally found associated with tremolite. Material was then mounted in a refractive index oil of 1.55 producing dispersion staining colors more closely associated with brucite/nemolite fibers. The fibers found in this material were also cross-referenced with SRM 1867 reference standards. Tina Perry was contacted and informed that these samples would be sent out for TEM bulk analysis at the cost of WEC for confirmation.

Results for TEM bulk analysis were received on 12/27/01 indicating that tremolite asbestos was present in white caulking material. Report number 10490 has been revised and the TEM analysis from EMSL has also been included in the packet for your review.

If you have any questions please feel free to call me at 843-0655 or 479-4747

Respectively submitted,

Shad Wells

result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report es only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were ...ived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report es only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were ...ved. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

Analyst: _____

Mohammad Rouf, MPH, CHMM
Laboratory Director

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and tested by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

## Summary of Polarized Light Microscopy

| AMA Sample Number | Client Sample # | Total Asbestos | Chrysotile Percent | Amosite Percent | Crocidolite Percent | Other Asbestos Percent | Mineral Wool Percent | Fiberglass Percent | Organic Percent | Synthetic Percent | Other Percent | Particulate Percent | Sample Color | Analyst ID | Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

Luis Bustillos

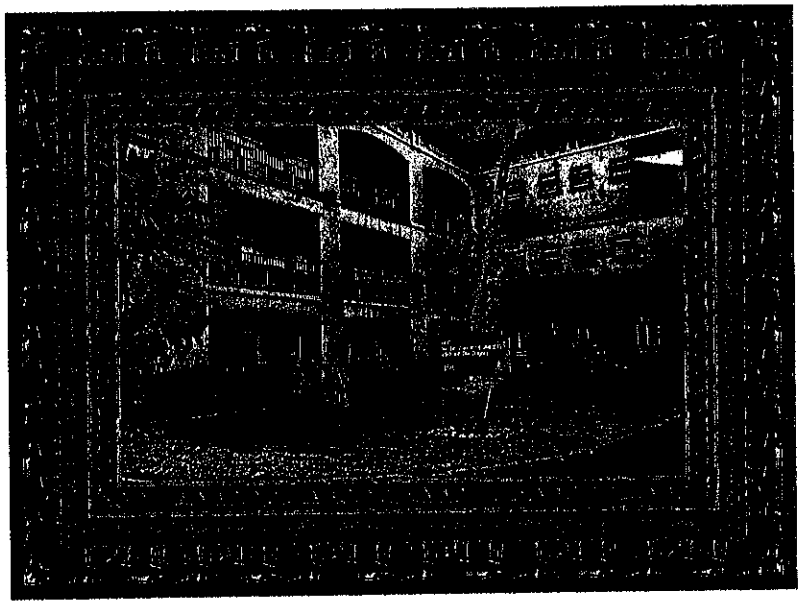
BLDG 358

# Schofield Barracks



# Building 358

# Executive Summary

Soil and Land Use Technology, Inc. (SaLUT) performed an asbestos identification and assessment reinspection of Building 358 located at Schofield Barracks, Hawaii. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 358 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included to the extent that the suspect materials found in those surveys could be identified. The survey was conducted by SaLUT in accordance with the U.S. Army Corps of Engineers Honolulu Engineer District Scope of Work dated September 18, 2001. The survey was conducted December 13, 2001, through February 19, 2002.

All accessible areas of the building were inspected for suspect asbestos-containing building materials (ACBMs). One hundred and eighty-four samples of suspect asbestos containing material were collected. Analytical results confirmed that asbestos is present as floor tile and floor tile mastic. A summary of the ACBMs encountered is provided on the next page. This report provides a detailed description of the ACBM locations, quantities, and hazard assessments based on conditions existing at the time of the inspection. No areas were found to contain ACBM causing high or imminent exposure potential.

# 1 Introduction

SaLUT performed an inspection of Building 357 to identify and assess all accessible ACBMs. This was a reinspection conducted at various times between December 11, 2001 and February 19, 2002 in accordance with the requirements outlined in the Scope of Work dated September 18, 2001. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 357 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included.

The following is a description of the building:

| | |
|---|---|
| **Function** | Barracks |
| **Size** | 90,000 square feet; three floors |
| **Foundation** | Concrete |
| **Exterior walls** | Concrete masonry units with plaster coating |
| **Roof** | Metal |
| **Mechanical systems** | Main mechanical room containing furnace and boiler on First Floor; secondary mechanical rooms on Second and Third Floors; pipes are insulated with fiberglass and foam |
| **Climate control** | Central heating system; individual room air conditioning units; ducts are insulated with foil-wrapped fiberglass |
| **Interior walls** | Concrete masonry units, drywall, plaster |
| **Floors** | Floor tile, concrete, ceramic tile, carpet |
| **Ceilings** | Ceiling tiles; fixed ceilings with ceiling plaster in some spaces |

Survey and assessment protocols were based on those adopted by the U.S. Environmental Protection Agency (EPA) as detailed in the Asbestos Hazard Emergency Response Act (AHERA; 40 CFR 763, Subpart E), and those of the Hawaii Department of Health in Hawaii Administrative Rule (HAR) 11-502 *Asbestos-Containing Materials in Schools.* In addition to identifying materials considered suspect by AHERA survey protocols, accessible roofing and other exterior materials were also addressed. SaLUT's inspectors identified and sampled all materials considered to be suspect under the regulations and other documents listed in Section 2 *Applicable Documents,* as well as those materials that have been found through other available literature and inspectors' experience (e.g., leveling paper and silver exterior paint) to potentially contain asbestos. This report does not address those suspect materials that would be expected in the building (e.g., sink undercoating in bathrooms of a residence)but were not encountered; the reader should assume that, if a suspect material is not mentioned in Section 3 *Findings,* the material was not found in the building.

Survey and assessment protocols were based on those adopted by the U.S. Environmental Protection Agency (EPA) as detailed in the Asbestos Hazard Emergency Response Act (AHERA; 40

CFR 763, Subpart E), and those of the Hawaii Department of Health in Hawaii Administrative Rule (HAR) 110502 *Asbestos-Containing Materials in Schools*. In addition to identifying materials considered suspect by AHERA survey protocols, accessible roofing and other exterior materials were also addressed. All samples were collected in accordance with the Sampling and Analysis Plan (SAP) for the task. The SAP is located in Appendix A of this volume. On-site inspection and assessments were conducted by Messers John Willard, Kenneth Reynolds, and John Veitch, EPA-accredited Asbestos Inspectors. Quality control review was conducted by Mr. Jeffrey Bauer, CIH, P.E., CSP (Certified Industrial Hygienist for this task) and Dr. David M. Heisler (Principal Investigator).

For the following reasons, SaLUT's survey differed from a normal reinspection, wherein the locations and conditions of previously identified ACBMs are verified, and the impacts of building renovations are determined:

- **Inability to identify the Baker survey's homogeneous materials with certainty.** Photographs of the positive materials were not included in the Baker inspection report available at the Directorate of Public Works (DPW). Many of the types of floor tile in the original survey were described by their predominant color only. Other types of floor tile appear to have received more than one description (possibly due to having been described by different inspectors).

- **Multiple layers of floor tile.** Many rooms had multiple layers of floor tile. Numerous instances were identified where floor tile located in the 1993 survey had been covered by other types of tile. This made it impractical to carry out the following tasks with completed accuracy:
  - Verify all locations of floor tiles identified in the original survey
  - Quantify types of floor tile
  - Identify all types of floor tile in the building (it was assumed that all types of floor tile were visible in at least one location)

To deal with these issues, under the direction of SaLUT's Project Manager and Principal Investigator, the inspectors modified the survey protocol as follows:

- **Floor tile.** Where a floor tile type could be sampled by SaLUT's inspectors without causing unacceptable damage, the original inspection was ignored, the floor tile was given a SaLUT homogeneous material identification, and the floor tile was sampled in accordance with the SAP. If the material could be equated to a type of Baker floor tile, this was noted. Where older types of floor tile were noted below SaLUT's samples, but the older materials could not be sampled, the floor tile and associated mastic were identified from the material locations in Baker's report. Quantities of asbestos-containing floor tile and associated floor tile mastic below the top layer of floor tile were assumed to extend throughout the entire room.

- **Other materials identified in previous inspections.** For all other materials (including those that were determined to not contain asbestos) that had been identified in the previous inspections, SaLUT's inspectors attempted to locate the materials. In a number of cases, the materials had been abated during various renovation projects.

The DPW survey identified one positive material (thermal system insulation on a pipe elbow, located in Room 142) not identified in the Baker survey. No photograph of this positive material was included in the inspection report. SaLUT's inspectors were unable to locate this material. It is possible that the material was abated.

- **Other materials not identified in previous inspection.** SaLUT's inspectors identified and sampled a number of suspect materials (e.g., types of caulking) that were not identified previously.
- **Ceiling Tile.** A number of samples were taken by SaLUT to confirm Baker's results that all no ceiling tiles contained asbestos. At that point, SaLUT stopped sampling ceiling tile and Baker's inspection results were accepted.

All samples were collected in accordance with the Sampling and Analysis Plan (SAP) for the task except as noted above. Where applicable, corners of wall-to-wall carpeting were lifted to examine flooring materials under the carpet. Metal roofs that would not support the inspector's weight were examined visually; if suspect materials were identified they were presumed to contain asbestos unless they could be sampled from an accessible edge of the roof. These situations, as well as other special situations, are discussed in the SAP located in Appendix A of this volume.

On-site inspection and assessments were conducted by John Willard, Kenneth Reynolds, and John Veitch, EPA and State of Hawai'i accredited Asbestos Inspectors. Quality control review was conducted by Dr. David M. Heisler (Principal Investigator).

# 3 Findings

Seventy homogeneous materials suspected of potentially containing asbestos were identified and sampled by SaLUT. SaLUT also identified, but did not sample, an additional six types of floor tile and six types of floor tile mastic that were found to be ACBM by Baker. SaLUT collected 184 bulk asbestos samples that were analyzed by White Environmental Consultants, Inc. and Globeteck at their National Voluntary Laboratory Accreditation Program (NVLAP) - accredited laboratories in Honolulu using polarized light microscopy/dispersion staining (PLM/DS) techniques. For some homogeneous materials, the laboratories used a *stop on positive* procedures whereby if one sample was confirmed as ACBM, the remaining samples were not analyzed. Composite samples of floor tile and floor tile mastic were split and the two components were analyzed individually as required by AHERA regulations. Therefore, the number of samples collected differs from the number of analyses. SaLUT submitted duplicates of sixteen of the samples analyzed by White to Globeteck for quality control analysis. One layer (floor tile) of two samples (B30 and B59) was found by Globeteck to be ACBM.

As a result of these laboratory analyses, 17 homogeneous materials (four types of floor tile, thirteen types of floor tile mastic) were confirmed as ACBM by sample analysis, in addition to three types of floor tile that were confirmed by Baker's analysis as being ACBM although SaLUT's analysis did not reveal asbestos. Four other types of asbestos-containing floor tile their associated asbestos-containing mastic identified by Baker remained in the building. The condition of the encountered positive materials was good, although some floor tiles are broken. Photographs 4 through 12 illustrate the ACBMs sampled by SaLUT. SaLUT was unable to photograph the ACBMs identified by Baker because they located below underneath floor tile sampled by SaLUT and were only revealed in the small areas where SaLUT's samples were taken.

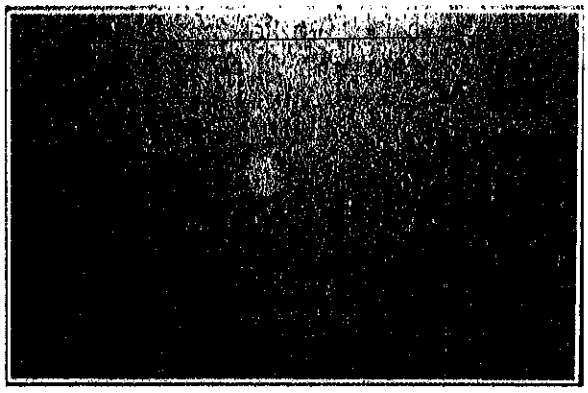
Baker indicated that plaster on the Second Floor interior was ACBM. Anecdotal evidence from various sources mentions occasional plaster samples from the exteriors of Quad buildings that were ACBM. However, as was the case for SaLUT's plaster samples, all of Baker's plaster samples from Quad C contained either no asbestos or less than 1 percent asbestos. Therefore, under AHERA and SaLUT's SAP, none of the plaster is ACBM.

All identified homogeneous materials considered to be potentially asbestos containing ("suspect") are listed on the *Homogeneous Materials Listing* (Table 1). These materials are grouped according to class (i.e., miscellaneous, surfacing, and thermal system insulation) and floor of the building. For each suspect material, the friability, general locations in the building, and sample numbers are indicated, as well as whether the material was determined to be ACBM or not. Red sample numbers indicate those samples that contained asbestos. Gray sample numbers indicate samples that were not analyzed because another sample of the same material contained asbestos. Suspect materials identified as ACBM by quality control analysis are identified by an asterisk (*) following the appropriate sample number. The ACBMs identified by Baker and not sampled by SaLUT are listed following SaLUT's homogeneous materials.

Sample collection sites for identified suspect ACBMs, as well as locations of identified ACBMs, are indicated on the building drawings (Figure 1).

Table 2, *Summary of Asbestos-Containing Materials,* provides a summary of the encountered ACBMs in the building. Each material is listed with information regarding the type, location, and condition of the ACBM, along with the recommended response action for the material.

Laboratory analysis sheets for all samples collected by SaLUT, including the quality control analyses, are located at the end of this report. Laboratory analysis sheets for samples collected during the previous surveys are found in those reports.



*Photograph 4. FM1. The mastic (FM1) below this floor tile (FT1) contains asbestos. The floor tile does not.*

(*) Denotes material confirmed as ACBM by QC sample analysis.

Note 1 — Although SaLUT's samples were negative for asbestos, Baker's samples of the same material contained greater than 2 percent asbestos.

Note 2 — Two layers of this floor tile were found in most of these rooms; square footage is for one layer.

# 4 Recommendations

Each friable ACBM was assessed and placed in the appropriate AHERA category as specified in 40 CFR, Part 763.88. In addition to the seven AHERA assessment categories, SaLUT added an eighth category for all non-friable ACBM.

SaLUT also categorized the condition of each ACBM at the time of the survey, as follows:

**Good** No damage observed

**Fair** The area of distributed damage was less than 10 percent and greater than 2 percent. The area of localized damage was less than 25 percent and greater than 2 percent.

**Poor** The area of distributed damage was greater than 10 percent and the localized damage was greater than 25 percent.

Based on the AHERA assessment category and SaLUT's condition assessment, SaLUT recommends on or more of the following response actions for each ACBM:

**O&M** Maintain the ACBM. Perform operations and maintenance procedures in a manner that does not damage the material. These procedures are specified in 29 CFR 1926.1101 and HAR 11-502-10. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

**Repair** Damaged areas should be repaired. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

Undamaged and repaired materials are subject to the O&M response action.

**Remove** The material should be removed. Removal must be performed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

If the building is demolished or renovation will impact any ACBMs, those materials must be removed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

Table 2 provides the AHERA assessment category, SaLUT's condition assessment, and SaLUT's recommended response action for each ACBM.

Table 3 provides SaLUT's cost estimate for abating (i.e., removing) each ACBM identified in the building. These estimates are conceptual cost estimates based on standard unit rates for different types of ACBM except for very small abatement projects, where the minimum cost is $1,200. Contractor mobilization/demobilization, transportation, disposal, and other miscellaneous costs are included in the unit. Operations and maintenance (O&M) costs are not provided as part of the recommended response cost.

**Table 3. Asbestos Abatement Cost Estimates.**

| Material Type | Location | Quantity | Unit Cost ($) | Total Removal Cost |

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report s only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were d. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analyst [signature] Date 12/12/01

QC [signature] Date 12/12/01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

QC [signature] Date 12-06-01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report s only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were d. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

## Summary of Polarized Light Microscopy

| AMA Sample Number | Client Sample # | Total Asbestos | Chrysotile Percent | Amosite Percent | Crocidolite Percent | Other Asbestos Percent | Mineral Wool Percent | Fiberglass Percent | Organic Percent | Synthetic Percent | Other Percent | Particulate Percent | Sample Color | Analyst ID | Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

# ASBESTOS INSPECTION REPORTS, QUAD C - BLDGS 355 AND 356

# ASBESTOS INSPECTION REPORTS

## Schofield Barracks
## Quad C - Buildings 355 and 356

Submitted to

U.S. Army Corps of Engineers
Honolulu Engineer District
Attn: CEPOH-EC-E, Building 230 (Miriam Koyanagi)
Fort Shafter, Hawaii 96858-5440

Submitted by

Soil and Land Use Technology, Inc.
3375 Koapaka Street, Suite B286
Honolulu, Hawai'i 96819

Contract DACA83-01-D-0017
Task Order #0001

March 2003

# PREFACE

These two volumes contain the asbestos reinspection reports for Quad C at Schofield Barracks. Quad C consists of Buildings 355, 356, 357, and 358. The asbestos reinspections were performed by Soil and Land Use Technology, Inc. under Task 0001 of Contract #DACA83-01-D-0017. The reinspections were performed between November 30, 2001 and March 12, 2002.

The following information is provided in each report:

- ❑ Name and location of the building inspected
- ❑ Date the inspection was performed
- ❑ Names of the certified inspectors who conducted the inspection
- ❑ Summary tables describing the type, location, condition, and quantity of identified asbestos containing materials
- ❑ Discussion of findings and recommendations
- ❑ Photographs of all identified asbestos containing materials
- ❑ Building drawings in Microstation® format, with sample numbers and locations of asbestos-containing materials indicated
- ❑ Laboratory sample analysis results and chain of custody documents for each sample collected from the building

Following the building inspection reports are the Sampling and Analysis Plan (SAP) for Task 0001 and certifications of the inspectors and analytical laboratories that participated in the surveys. The SAP details the methodology used in performing the inspections, including discussion of applicable regulations and sampling protocols. The certifications include the following:

- ❑ Asbestos Hazard Emergency Response Act (AHERA) Inspector certificates
- ❑ State of Hawai'i Inspector cards
- ❑ National Voluntary Laboratory Accreditation Program (NVLAP) certificates and State of Hawai'i certification letters for analytical laboratories

# Schofield Barracks

# Building 355

# Executive Summary

Soil and Land Use Technology, Inc. (SaLUT) performed an asbestos identification and assessment reinspection of Building 355 located at Schofield Barracks, Hawaii. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 355 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included to the extent that the suspect materials found in those surveys could be identified. The survey was conducted by SaLUT in accordance with the U.S. Army Corps of Engineers Honolulu Engineer District Scope of Work dated September 18, 2001. The survey was conducted December 13, 2001, through February 20, 2002.

All accessible areas of the building were inspected for suspect asbestos-containing building materials (ACBMs). One hundred and forty-seven samples of suspect asbestos containing material were collected. Analytical results confirmed that asbestos is present as floor tile, floor tile mastic, and ceiling plaster. A summary of the ACBMs encountered is provided on the next page. This report provides a detailed description of the ACBM locations, quantities, and hazard assessments based on conditions existing at the time of the inspection. No areas were found to contain ACBM causing high or imminent exposure potential.

## BUILDING SUMMARY

| | |
|---|---|
| **Facility** | Schofield Barracks |
| **Building** | 355 |
| **Inspector(s)** | John Willard, Kenneth Reynolds, JohnVeitch |
| **Inspection Date(s)** | December 13, 2001 through February 20, 2002 |
| **Building Area** | 69,000 s.f. |

**Inaccessible areas (overview)**

None

**Areas with limited access (overview)**

Beneath wall-to-wall carpeting (indicated as "LCA" on building drawings)

**Areas with no access (overview)**

Above ceilings with no access (indicated as "NAC" on building drawings)
Rooms that were sealed (indicated as "NA" on building drawings)

| Types of ACBMs Encountered | | Approximate Quantity |
|---|---|---|
| **Thermal System Insulation** | None | |
| **Surfacing** | Ceiling plaster | 840 sf |
| **Miscellaneous** | Floor tile<br>Floor tile mastic | 10,870 sf<br>33,325 sf |
| **Functional Areas with High to Imminent Exposure Potential** | None | |

# 1 Introduction

SaLUT performed an inspection of Building 355 to identify and assess all accessible ACBMs. This was a reinspection conducted on December 13, 2001, through February 20, 2002, in accordance with the requirements outlined in the Scope of Work dated September 18, 2001. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 355 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included.

The following is a description of the building:

| | |
|---|---|
| **Function** | Barracks |
| **Size** | 69,000 square feet; three floors |
| **Foundation** | Concrete |
| **Exterior walls** | Concrete masonry units with plaster coating |
| **Roof** | Asphalt roofing paper over foam |
| **Mechanical systems** | Main mechanical room containing furnace and boiler on First Floor; secondary mechanical rooms on Second and Third Floors; pipes are uninsulated |
| **Climate control** | Central heating and cooling system; ducts are bare or insulated with fiberglass |
| **Interior walls** | Concrete masonry units, drywall |
| **Floors** | Floor tile, concrete, carpet, ceramic tile |
| **Ceilings** | Ceiling tiles; fixed ceilings with ceiling plaster in some spaces |

Survey and assessment protocols were based on those adopted by the U.S. Environmental Protection Agency (EPA) as detailed in the Asbestos Hazard Emergency Response Act (AHERA; 40 CFR 763, Subpart E), and those of the Hawaii Department of Health in Hawaii Administrative Rule (HAR) 11-502 *Asbestos-Containing Materials in Schools.* In addition to identifying materials considered suspect by AHERA survey protocols, accessible roofing and other exterior materials were also addressed. SaLUT's inspectors identified and sampled all materials considered to be suspect under the regulations and other documents listed in Section 2 *Applicable Documents,* as well as those materials that have been found through other available literature and inspectors' experience (e.g., leveling paper and silver exterior paint) to potentially contain asbestos. This report does not address those suspect materials that would be expected in the building (e.g., sink undercoating in bathrooms of a residence)but were not encountered; the reader should assume that, if a suspect material is not mentioned in Section 3 *Findings,* the material was not found in the building.

For the following reasons, SaLUT's survey differed from a normal reinspection, wherein the locations and conditions of previously identified ACBMs are verified, and the impacts of building renovations are determined:

- **Inability to identify the Baker survey's homogeneous materials with certainty.** Photographs of the positive materials were not included in the Baker inspection report available at the Directorate of Public Works (DPW). Many of the types of floor tile in the original survey were described by their predominant color only. Other types of floor tile appear to have received more than one description (possibly due to having been described by different inspectors).

- **Multiple layers of floor tile.** Many rooms had multiple layers of floor tile. Numerous instances were identified where floor tile located in the 1993 survey had been covered by other types of tile. This made it impractical to carry out the following tasks with completed accuracy:
  - Verify all locations of floor tiles identified in the original survey
  - Quantify types of floor tile
  - Identify all types of floor tile in the building (it was assumed that all types of floor tile were visible in at least one location)

To deal with these issues, under the direction of SaLUT's Project Manager and Principal Investigator, the inspectors modified the survey protocol as follows:

- **Floor tile.** Where a floor tile type could be sampled by SaLUT's inspectors without causing unacceptable damage, the original inspection was ignored, the floor tile was given a SaLUT homogeneous material identification, and the floor tile was sampled in accordance with the SAP. If the material could be equated to a type of Baker floor tile, this was noted. Where older types of floor tile were noted below SaLUT's samples, but the older materials could not be sampled, the floor tile and associated mastic were identified from the material locations in Baker's report. Quantities of asbestos-containing floor tile and associated floor tile mastic below the top layer of floor tile were assumed to extend throughout the entire room.

- **Other materials identified in previous inspections.** For all other materials (including those that were determined to not contain asbestos) that had been identified in the previous inspections, SaLUT's inspectors attempted to locate the materials. In a number of cases, the materials had been abated during various renovation projects.

  The DPW survey identified one positive material (white/cream sealant above the ceiling of Rooms 144 and 333) not identified in the Baker survey. No photograph of this positive material was included in the inspection report. SaLUT's inspectors were unable to locate this material. It is possible that the material was abated.

- **Other materials not identified in previous inspection.** SaLUT's inspectors identified and sampled a number of suspect materials (e.g., types of caulking) that were not identified previously.

- ❑ Ceiling Tile. A number of samples were taken by SaLUT to confirm Baker's results that all no ceiling tiles contained asbestos. At that point, SaLUT stopped sampling ceiling tile and Baker's inspection results were accepted.

All samples were collected in accordance with the Sampling and Analysis Plan (SAP) for the task except as noted above. Where applicable, corners of wall-to-wall carpeting were lifted to examine flooring materials under the carpet. Metal roofs that would not support the inspector's weight were examined visually; if suspect materials were identified they were presumed to contain asbestos unless they could be sampled from an accessible edge of the roof. These situations, as well as other special situations, are discussed in the SAP located in Appendix A of this volume.

On-site inspection and assessments were conducted by John Willard, Kenneth Reynolds, and John Veitch, EPA and State of Hawai'i accredited Asbestos Inspectors. Quality control review was conducted by Dr. David M. Heisler (Principal Investigator).

# 3 Findings

Sixty-four homogeneous materials suspected of potentially containing asbestos were identified and sampled by SaLUT. SaLUT also identified, but did not sample, an additional 12 types of floor tile and mastic that were found to be ACBM by Baker. SaLUT collected 147 bulk asbestos samples that were analyzed by White Environmental Consultants, Inc. and Globeteck at their National Voluntary Laboratory Accreditation Program (NVLAP) - accredited laboratories in Honolulu using polarized light microscopy/dispersion staining (PLM/DS) techniques. For some homogeneous materials, the laboratories used a *stop on positive* procedures whereby if one sample was confirmed as ACBM, the remaining samples were not analyzed. Composite samples of floor tile and floor tile mastic were split and the two components were analyzed individually as required by AHERA regulations. Therefore, the number of samples collected differs from the number of analyses. SaLUT submitted duplicates of six of the samples analyzed by White to Globeteck for quality control analysis. Both layers (floor tile and mastic) of one sample (B58) were found by Globeteck to be ACBM. Laboratory analysis sheets for all samples collected by SaLUT, including the quality control analyses, are located at the end of this report. Laboratory analysis sheets for samples collected during the previous surveys are found in those reports.

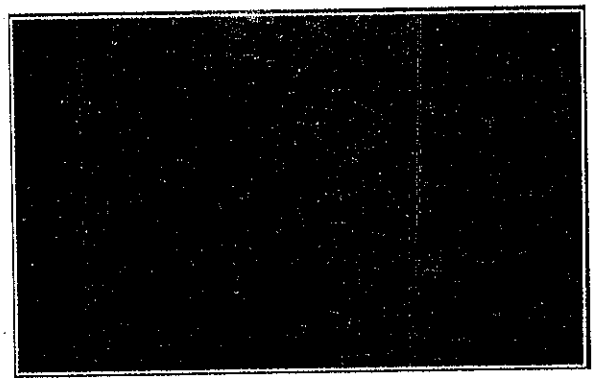
As a result of these laboratory analyses, 12 homogeneous materials (two types of floor tile, nine types of floor tile mastic, and ceiling plaster) were confirmed as ACBM by sample analysis, in addition to the 12 types of asbestos-containing floor tile and mastic identified by Baker and remaining in the building. The condition of the encountered positive materials was good, although some floor tiles are broken. Photographs 4 through 13 illustrate the ACBMs sampled by SaLUT. SaLUT was unable to photograph the ACBMs identified by Baker because they located below underneath floor tile sampled by SaLUT and were only revealed in the small areas where SaLUT's samples were taken.

Baker indicated that plaster on the Second Floor exterior was ACBM. Anecdotal evidence from various sources mentions occasional plaster samples from the exteriors of Quad buildings that were ACBM. However, as was the case for SaLUT's plaster samples, all of Baker's plaster samples (including interior plaster) from Quad C contained either no asbestos or less than 1 percent asbestos. Therefore, under AHERA and SaLUT's SAP, none of the plaster is ACBM.

All identified homogeneous materials considered to be potentially asbestos containing ("suspect") are listed on the *Homogeneous Materials Listing* (Table 1). These materials are grouped according to class (i.e., miscellaneous, surfacing, and thermal system insulation) and floor of the building. For each suspect material, the friability, general locations in the building, and sample numbers are indicated, as well as whether the material was determined to be ACBM or not. Red sample numbers indicate those samples that contained asbestos. Gray sample numbers indicate samples that were not analyzed because another sample of the same material contained asbestos. Suspect materials identified as ACBM by quality control analysis are identified by an asterisk (*) following the appropriate sample number. The ACBMs identified by Baker and not sampled by SaLUT are listed following SaLUT's homogeneous materials.

Sample collection sites for identified suspect ACBMs, as well as locations of identified ACBMs, are indicated on the building drawings (Figure 1).

Table 2, *Summary of Asbestos-Containing Materials*, provides a summary of the encountered ACBMs in the building. Each material is listed with information regarding the type, location, and condition of the ACBM, along with the recommended response action for the material.



*Photograph 4. FT2 and FM2. This floor tile (FT2) and mastic (FM2) both contain asbestos.*

# 4 Recommendations

Each friable ACBM was assessed and placed in the appropriate AHERA category as specified in 40 CFR, Part 763.88. In addition to the seven AHERA assessment categories, SaLUT added an eighth category for all non-friable ACBM.

SaLUT also categorized the condition of each ACBM at the time of the survey, as follows:

**Good** No damage observed

**Fair** The area of distributed damage was less than 10 percent and greater than 2 percent. The area of localized damage was less than 25 percent and greater than 2 percent.

**Poor** The area of distributed damage was greater than 10 percent and the localized damage was greater than 25 percent.

Based on the AHERA assessment category and SaLUT's condition assessment, SaLUT recommends on or more of the following response actions for each ACBM:

**O&M** Maintain the ACBM. Perform operations and maintenance procedures in a manner that does not damage the material. These procedures are specified in 29 CFR 1926.1101 and HAR 11-502-10. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

**Repair** Damaged areas should be repaired. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

Undamaged and repaired materials are subject to the O&M response action.

**Remove** The material should be removed. Removal must be performed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

If the building is demolished or renovation will impact any ACBMs, those materials must be removed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

Table 2 provides the AHERA assessment category, SaLUT's condition assessment, and SaLUT's recommended response action for each ACBM.

**Table 2. Summary of Asbestos-Containing Materials.**

| Material Description | Location | Quantity | Friable | Cond. Assess. | AHERA Assess. Cat. | Recommended Response Action | Photo Ref. |
|---|---|---|---|---|---|---|---|

Table 3 provides SaLUT's cost estimate for abating (i.e., removing) each ACBM identified in the building. These estimates are conceptual cost estimates based on standard unit rates for different types of ACBM except for very small abatement projects, where the minimum cost is $1,200. Contractor mobilization/demobilization, transportation, disposal, and other miscellaneous costs are included in the unit. Operations and maintenance (O&M) costs are not provided as part of the recommended response cost.

**Table 3. Asbestos Abatement Cost Estimates.**

| Material Type | Location | Quantity | Unit Cost ($) | Total Removal Cost |
|---|---|---|---|---|
| First Floor | | | | |
| FM2 Black mastic below FT2 | Below FT2 | 1,363 sf | 3 | $4,089 |

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Comments:

**Analyst** _____ **Date** 12/24/01
**QC** _____ **Date** 12/24/01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

# Bulk Sample Analysis for Asbestos

WEC Project #: H01-1284
Client Project#:

Report #: 10684
Report Date: 12/27/01

Comments:

Analyst [signature] Date 12/26/01
QC [signature] Date 12/27/01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report [illegible] only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were [illegible]d. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

**Analyst:** _____

Mohammad Rouf, MPH, CHMM
Laboratory Director

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and tested by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

BLDG 356

# Schofield Barracks

# Building 356

# Executive Summary

Soil and Land Use Technology, Inc. (SaLUT) performed an asbestos identification and assessment reinspection of Building 356 located at Schofield Barracks, Hawaii. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 356 of Quad C at the Schofield Barracks Military Reservation, Hawaii,* Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawaii,* Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawaii) were included to the extent that the suspect materials found in those surveys could be identified. The survey was conducted by SaLUT in accordance with the U.S. Army Corps of Engineers Honolulu Engineer District Scope of Work dated September 18, 2001. The survey was conducted between December 3, 2001 and March 7, 2002.

All accessible areas of the building were inspected for suspect asbestos-containing building materials (ACBMs). One hundred and forty-four samples of suspect asbestos containing material were collected. Analytical results confirmed that asbestos is present as floor tile and floor tile mastic. A summary of the ACBMs encountered is provided on the next page. This report provides a detailed description of the ACBM locations, quantities, and hazard assessments based on conditions existing at the time of the inspection. No areas were found to contain ACBM causing high or imminent exposure potential.

# 1 Introduction

SaLUT performed an inspection of Building 356 to identify and assess all accessible ACBMs. This was a reinspection conducted between December 3, 2001 and March 7, 2002, in accordance with the requirements outlined in the Scope of Work dated September 18, 2001. The results of the original survey conducted in July and August 1993 (*Asbestos Survey and Management Plan Report for Building 356 of Quad C at the Schofield Barracks Military Reservation, Hawai'i*, Baker Environmental, Inc. for the Corps of Engineers, Fort Shafter) and a survey of limited scope conducted in 2000 (*Asbestos Survey for Quad C Buildings 355, 356, 357, 358 Renovation Project Schofield Barracks, Oahu, Hawai'i*, Environmental Division, Directorate of Public Works, U.S. Army Garrison Hawai'i) were included.

The following is a description of the building:

| | |
|---|---|
| **Function** | Barracks |
| **Size** | 75,000 square feet; three floors |
| **Foundation** | Concrete |
| **Exterior walls** | Concrete masonry units with plaster coating |
| **Roof** | Metal |
| **Mechanical systems** | Main mechanical room containing furnace and boiler on First Floor; secondary mechanical rooms on Second and Third Floors; pipes are insulated with rubber and foam |
| **Climate control** | Central heating system; individual room air conditioning units; ducts are insulated with fiberglass |
| **Interior walls** | Concrete masonry units, drywall |
| **Floors** | Floor tile, concrete, ceramic tile |
| **Ceilings** | Ceiling tiles; fixed ceilings with ceiling plaster in some spaces |

Survey and assessment protocols were based on those adopted by the U.S. Environmental Protection Agency (EPA) as detailed in the Asbestos Hazard Emergency Response Act (AHERA; 40 CFR 763, Subpart E), and those of the Hawaii Department of Health in Hawaii Administrative Rule (HAR) 11-502 *Asbestos-Containing Materials in Schools*. In addition to identifying materials considered suspect by AHERA survey protocols, accessible roofing and other exterior materials were also addressed. SaLUT's inspectors identified and sampled all materials considered to be suspect under the regulations and other documents listed in Section 2 *Applicable Documents*, as well as those materials that have been found through other available literature and inspectors' experience (e.g., leveling paper and silver exterior paint) to potentially contain asbestos. This report does not address those suspect materials that would be expected in the building (e.g., sink undercoating in bathrooms of a residence)but were not encountered; the reader should assume that, if a suspect material is not mentioned in Section 3 *Findings*, the material was not found in the building.

For the following reasons, SaLUT's survey differed from a normal reinspection, wherein the locations and conditions of previously identified ACBMs are verified, and the impacts of building renovations are determined:

- **Inability to identify the Baker survey's homogeneous materials with certainty.** Photographs of the positive materials were not included in the Baker inspection report available at the Directorate of Public Works (DPW). Many of the types of floor tile in the original survey were described by their predominant color only. Other types of floor tile appear to have received more than one description (possibly due to having been described by different inspectors).

- **Multiple layers of floor tile.** Many rooms had multiple layers of floor tile. Numerous instances were identified where floor tile located in the 1993 survey had been covered by other types of tile. This made it impractical to carry out the following tasks with completed accuracy:
  - Verify all locations of floor tiles identified in the original survey
  - Quantify types of floor tile
  - Identify all types of floor tile in the building (it was assumed that all types of floor tile were visible in at least one location)

To deal with these issues, under the direction of SaLUT's Project Manager and Principal Investigator, the inspectors modified the survey protocol as follows:

- **Floor tile.** Where a floor tile type could be sampled by SaLUT's inspectors without causing unacceptable damage, the original inspection was ignored, the floor tile was given a SaLUT homogeneous material identification, and the floor tile was sampled in accordance with the SAP. If the material could be equated to a type of Baker floor tile, this was noted. Where older types of floor tile were noted below SaLUT's samples, but the older materials could not be sampled, the floor tile and associated mastic were identified from the material locations in Baker's report.

- **Other materials identified in previous inspections.** For all other materials (including those that were determined to not contain asbestos) that had been identified in the previous inspections, SaLUT's inspectors attempted to locate the materials. In a number of cases, the materials had been abated during various renovation projects. Where a material was identified, the SaLUT's lead inspector determined whether additional sampling was warranted.

  The DPW survey identified one positive material (white caulk on a duct above the ceiling of Room 326) not identified in the Baker survey. No photograph of this positive material was included in the inspection report. SaLUT's inspectors were unable to locate this material. It is possible that the material was abated.

- **Other materials not identified in previous inspection.** SaLUT's inspectors identified and sampled a number of suspect materials (e.g., types of caulking) that were not identified previously.

- ❑ **Ceiling Tile.** A number of samples were taken by SaLUT to confirm Baker's results that all no ceiling tiles contained asbestos. At that point, SaLUT stopped sampling ceiling tile and Baker's inspection results were accepted.

All samples were collected in accordance with the Sampling and Analysis Plan (SAP) for the task except as noted above. Where applicable, corners of wall-to-wall carpeting were lifted to examine flooring materials under the carpet. Metal roofs that would not support the inspector's weight were examined visually; if suspect materials were identified they were presumed to contain asbestos unless they could be sampled from an accessible edge of the roof. These situations, as well as other special situations, are discussed in the SAP located in Appendix A of this volume.

On-site inspection and assessments were conducted by John Willard, Kenneth Reynolds, and John Veitch, EPA and State of Hawai'i accredited Asbestos Inspectors. Quality control review was conducted by Dr. David M. Heisler (Principal Investigator).

# 3 Findings

Seventy-seven homogeneous materials suspected of potentially containing asbestos were identified and sampled by SaLUT. SaLUT also identified, but did not sample, an additional 30 types of floor tile and mastic that were found to be ACBM by Baker. SaLUT collected 144 bulk asbestos samples that were analyzed by White Environmental Consultants, Inc. and Globeteck at their National Voluntary Laboratory Accreditation Program (NVLAP) - accredited laboratories in Honolulu using polarized light microscopy/dispersion staining (PLM/DS) techniques. For some homogeneous materials, the laboratories used a *stop on positive* procedures, whereby if one sample was confirmed as ACBM, the remaining samples were not analyzed. Composite samples of floor tile and floor tile mastic were split and the two components were analyzed individually as required by AHERA regulations. Therefore, the number of samples collected differs from the number of analyses. SaLUT submitted duplicates of ten of the samples analyzed by White to Globeteck for quality control analysis. One layer (floor tile) of one sample (B19) was found by Globeteck to be ACBM.

As a result of these laboratory analyses, 20 homogeneous materials (two types of floor tile and eighteen types of floor tile mastic) were confirmed as ACBM by sample analysis, in addition to the 30 types of asbestos-containing floor tile and mastic identified by Baker, which remain in the building. The condition of the encountered positive materials was good, although some floor tiles are broken. Photographs 4 through 21 illustrate the ACBMs sampled by SaLUT. SaLUT was unable to photograph the ACBMs identified by Baker because they located below underneath floor tile sampled by SaLUT and were only revealed in the small areas where SaLUT's samples were taken.

Baker indicated that plaster on the exterior of one floor was ACBM. Anecdotal evidence from various sources mentions occasional plaster samples from the exteriors of Quad buildings that were ACBM. However, As was the case for SaLUT's plaster samples, all of Baker's plaster samples (including interior plaster) from Quad C contained either no asbestos or less than 1 percent asbestos. Therefore, under AHERA and SaLUT's SAP, none of the plaster is ACBM.

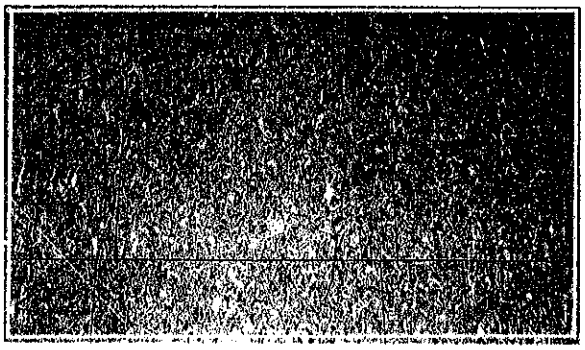
All identified homogeneous materials considered to be potentially asbestos containing ("suspect") are listed on the *Homogeneous Materials Listing* (Table 1). These materials are grouped according to class (i.e., miscellaneous, surfacing, and thermal system insulation) and floor of the building. For each suspect material, the friability, general locations in the building, and sample numbers are indicated, as well as whether the material was determined to be ACBM or not. Red sample numbers indicate those samples that contained asbestos. Gray sample numbers indicate samples that were not analyzed because another sample of the same material contained asbestos. Suspect materials identified as ACBM by quality control analysis are identified by an asterisk (*) following the appropriate sample number. The ACBMs identified by Baker and not sampled by SaLUT are listed following SaLUT's homogeneous materials.

Sample collection sites for identified suspect ACBMs, as well as locations of identified ACBMs, are indicated on the building drawings (Figure 1).

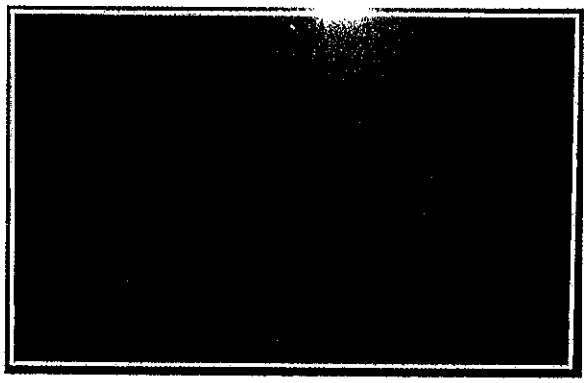
Table 2, *Summary of Asbestos-Containing Materials,* provides a summary of the encountered ACBMs in the building. Each material is listed with information regarding the type, location, and condition of the ACBM, along with the recommended response action for the material.

Laboratory analysis sheets for all samples collected by SaLUT, including the quality control analyses, are located at the end of this report. Laboratory analysis sheets for samples collected during the previous surveys are found in those reports.

*Photograph 4. FM1. The mastic (FM1) below this floor tile (FT1) contains asbestos. The floor tile does not contain asbestos.*



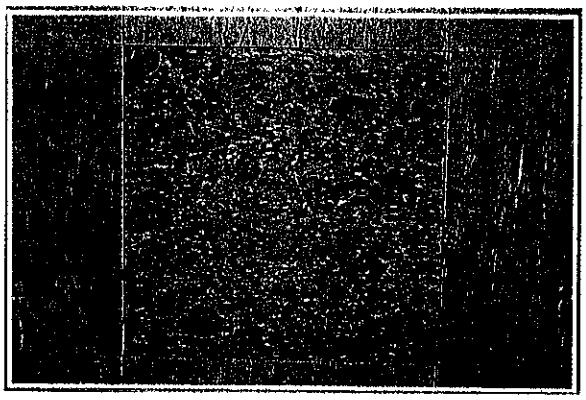
*Photograph 5. FM2. The mastic (FM2) below this floor tile (FT2) contains asbestos. The floor tile does not contain asbestos.*



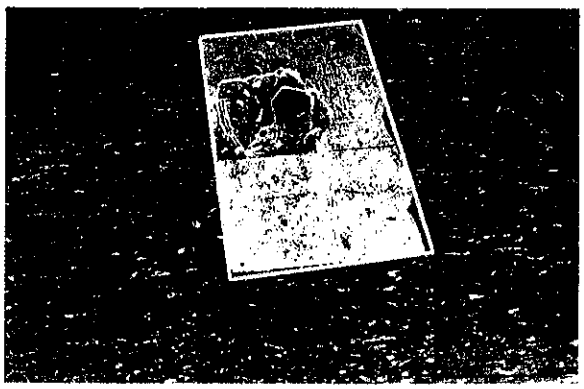
*Photograph 6. FM5. The mastic (FM5) below this floor tile (FT5) contains asbestos. The floor tile does not contain asbestos.*

*Photograph 7. FM6. The mastic (FM6) below this floor tile (FT6) contains asbestos. The floor tile does not contain asbestos.*

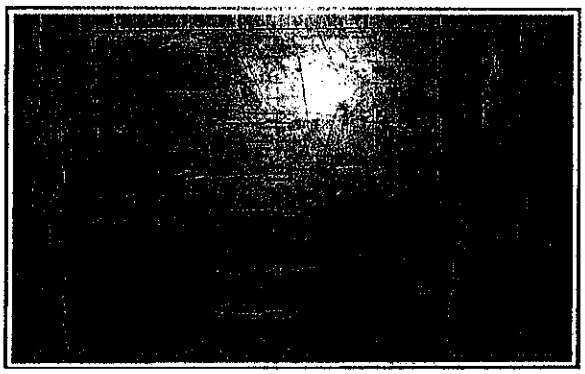
*Photograph 8. FM9 and FM24. This floor tile (FT9) on the First Floor is the same as FT24 on the Second Floor. The mastics below both floor tiles contain asbestos. Neither of the floor tiles contains asbestos.*



*Photograph 9. FM10. The mastic (FM10) below this floor tile (FT10) contains asbestos. The floor tile does not contain asbestos.*

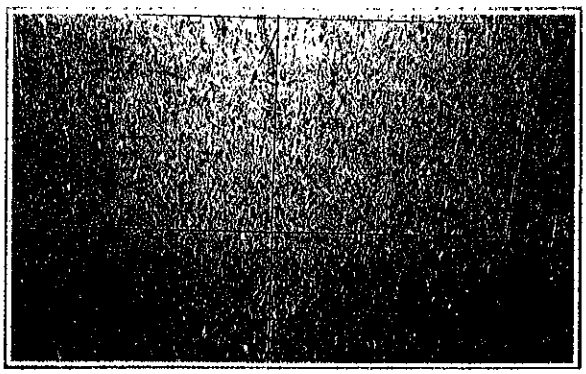


*Photograph 10. FM11. The mastic (FM11) below this tan floor tile (FT11) contains asbestos. The floor tile does not contain asbestos.*

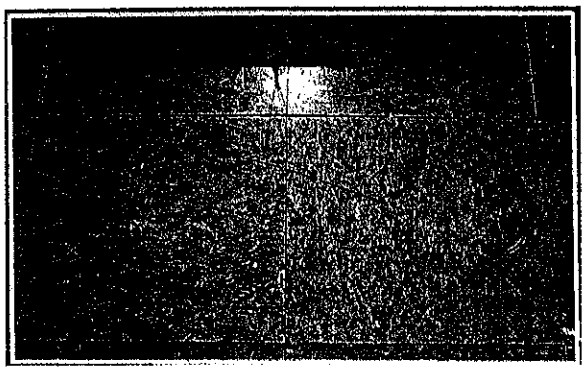


*Photograph 11. FM12. The mastic (FM12) below this floor tile (FT12) contains asbestos. The floor tile does not contain asbestos.*

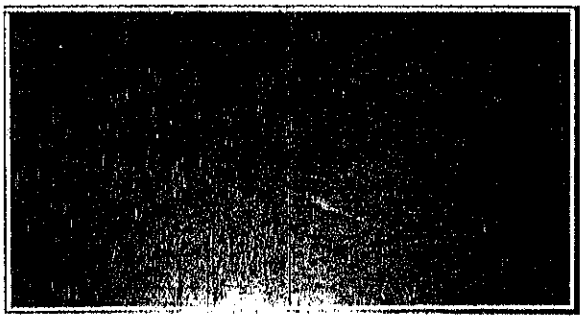
*Photograph 12. FM14. The mastic (FM14) below this floor tile (FT14) contains asbestos. The floor tile does not contain asbestos.*



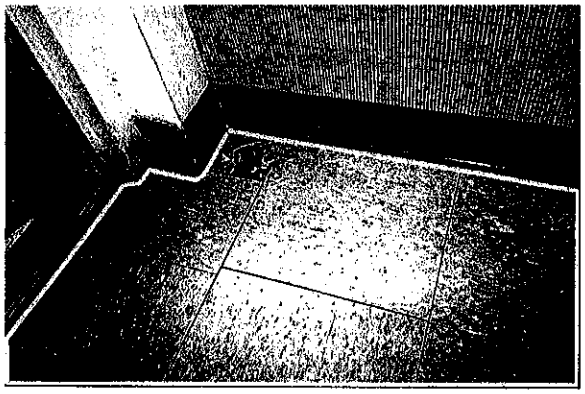
*Photograph 13. FM15. The mastic (FM15) below this floor tile (FT15) contains asbestos. The floor tile does not contain asbestos.*



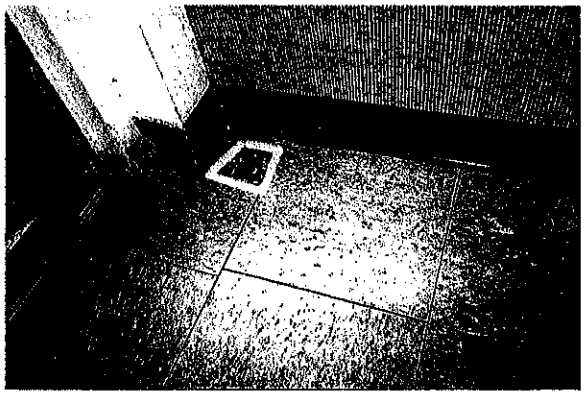
*Photograph 14. FM16. The mastic (FM16) below this floor tile (FT16) contains asbestos. The floor tile does not contain asbestos.*



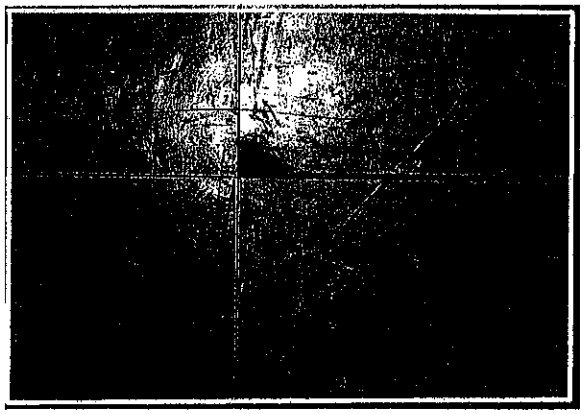
*Photograph 15. FM17. The mastic (FM17) below this floor tile (FT17) contains asbestos. The floor tile does not contain asbestos.*



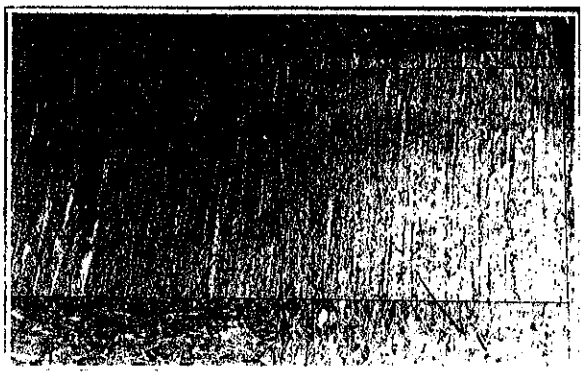
*Photograph 16. FM18. The mastic (FM18) below this beige floor tile (FT18) contains asbestos. The floor tile does not contain asbestos.*



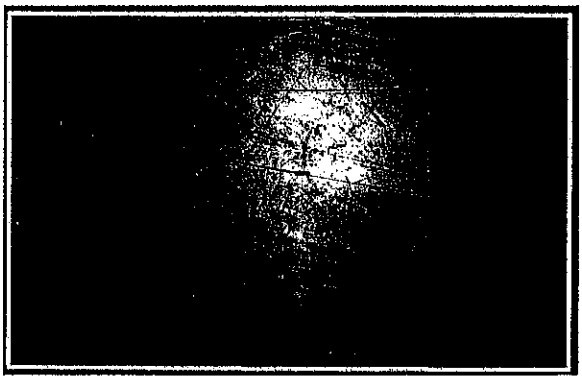
*Photograph 17. FM19. The mastic (FM19) below this floor tile (FT19) contains asbestos. The floor tile does not contain asbestos.*



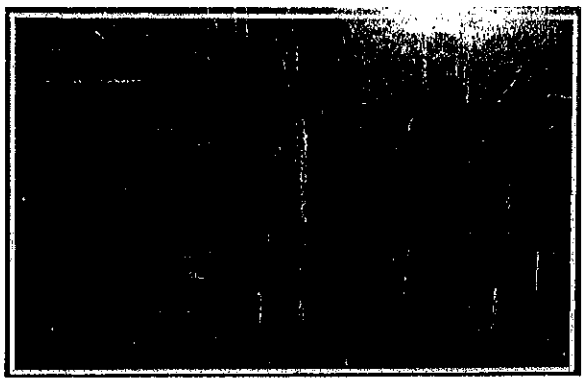
*Photograph 18. FT21 and FM21. This floor tile (FT21) and the mastic below it (FM21) contain asbestos.*



*Photograph 19. FM22. The mastic (FM22) below this floor tile (FT22) contains asbestos. The floor tile does not contain asbestos.*



*Photograph 20. FM28. The mastic (FM28) below this floor tile (FT28) contains asbestos. The floor tile does not contain asbestos.*



*Photograph 21. FT13. The floor tile (FT13) contains asbestos. The mastic below (FM13) does not contain asbestos.*

**Table 1. Homogeneous Materials Listing. Descriptions of asbestos-containing materials from Baker's survey are taken from Baker's report.**

# 4 Recommendations

Each friable ACBM was assessed and placed in the appropriate AHERA category as specified in 40 CFR, Part 763.88. In addition to the seven AHERA assessment categories, SaLUT added an eighth category for all non-friable ACBM.

SaLUT also categorized the condition of each ACBM at the time of the survey, as follows:

**Good** No damage observed

**Fair** The area of distributed damage was less than 10 percent and greater than 2 percent. The area of localized damage was less than 25 percent and greater than 2 percent.

**Poor** The area of distributed damage was greater than 10 percent and the localized damage was greater than 25 percent.

Based on the AHERA assessment category and SaLUT's condition assessment, SaLUT recommends on or more of the following response actions for each ACBM:

**O&M** Maintain the ACBM. Perform operations and maintenance procedures in a manner that does not damage the material. These procedures are specified in 29 CFR 1926.1101 and HAR 11-502-10. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

**Repair** Damaged areas should be repaired. Repair of damaged material must be performed in accordance with 29 CFR 1926.1101 and as specified in the management plan for the installation unless otherwise authorized, all repairs should be handled by State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101.

Undamaged and repaired materials are subject to the O&M response action.

**Remove** The material should be removed. Removal must be performed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

If the building is demolished or renovation will impact any ACBMs, those materials must be removed by a State of Hawai'i-licensed contractor in accordance with 29 CFR 1926.1101. Removal must follow the most stringent guidelines provided by either the State of Hawai'i or Federal regulations.

Table 2 provides the AHERA assessment category, SaLUT's condition assessment, and SaLUT's recommended response action for each ACBM.

**Table 2. Summary of Asbestos-Containing Materials.**

| Material Description | Location | Quantity | Friable | Cond. Assess. | AHERA Assess. Cat. | Recommended Response Action | Photo Ref. |

Table 3 provides SaLUT's cost estimate for abating (i.e., removing) each ACBM identified in the building. These estimates are conceptual cost estimates based on standard unit rates for different types of ACBM except for very small abatement projects, where the minimum cost is $1,200. Contractor mobilization/demobilization, transportation, disposal, and other miscellaneous costs are included in the unit. Operations and maintenance (O&M) costs are not provided as part of the recommended response cost.

**Table 3. Asbestos Abatement Cost Estimates.**

| Material Type | Location | Quantity | Unit Cost ($) | Total Removal Cost |
|---|---|---|---|---|
| First Floor | | | | |
| FM5 Black/yellow mastic | Below FT5 (rooms 119, 149, 150, 162) | 1, 015 sf | 3 | $3,045 |
| FM6 Yellow/gray mastic | Below FT6 (rooms 114, 124, 150, 156) | 1,167 sf | 3 | 3,501 |

Report Date: 12/9/01

Comments:

Analyst _____ Date 12-10-01
QC _____ Date 12/14/01

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

# Bulk Sample Analysis for Asbestos

**WEC Project #:** H02-038
**Client Project#:** 01-290

**Report #:** 11128
**Report Date:** 1/23/02

Comments:

**Analyst** _____ **Date** 1/23/02
**QC** _____ **Date** 1/23/02

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Globeteck

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report [illegible]es only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were [illegible]ed. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

Globeteck

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and analyzed by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

Analysis performed by EPA Method 600/R-93/116 with dispersion staining microscopy. All quantities reported are based on visual estimation by PLM, unless point-counting method is requested and noted for the sample. Test report relates only to items tested and must not be used by client to claim product endorsement by NVLAP or any agency of the U.S. Government. Test reports must not be reproduced without the approval of WEC Inc., and are subject to WEC Inc. General Terms and Conditions (see reverse). White Environmental Consultants, Inc. is an NVLAP accredited laboratory for bulk asbestos analysis. (Lab# 200350-0)

Globeteck

The result quantitations reported are an estimation based on the methods of visual microscopic estimation which is considered only a semi-quantitative technique. This report applies only to the sample(s) received and tested by GLOBETECK. Results do not necessarily reflect the makeup of the entire span of the material from which the samples were derived. Sampling techniques and/or sample handling may affect the integrity of the sample/s before submission to GLOBETECK. Laboratory and hence the outcome of the laboratory results. Samples not destroyed by testing are retained a minimum of thirty days. GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

GLOBETECK Laboratory, recommends re-analysis by point count or Transmission Electron Microscopy (TEM) for materials that are found to contain less than ten percent (<10%) asbestos by PLM. This report cannot be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without the written consent of GLOBETECK.

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

Luis Bustillos

This report applies only to the sample, or samples, investigated and is not necessarily indicative of the quality or condition apparently identical or similar products. As a mutual protection to clients, the public and these Laboratories, this report is submitted and accepted for the exclusive use of the client to whom it is addressed and upon the condition that it is not to be used, in whole or in part, in any advertising or publicity matter without prior written authorization from us. Sample types, locations and collection protocols are based upon the information provided by the persons submitting them and, unless collected by personnel of these Laboratories, we expressly disclaim any knowledge and liability for the accuracy and completeness of this information. Residual sample material will be discarded in acc[illegible]nce with the appropriate regulatory guidelines, unless otherwise requested by the client. [illegible]AP Accreditation applies only to polar[illegible]ight microscopy of bulk samples and transmission electron microscopy of AHERA air sa[illegible]

WATER DISTRIBUTION ANALYSIS

# FY03 MCA WBR, Quad C (Bldg 355, 356, 357, 358)
## WATER DISTRIBUTION ANALYSIS

### CALCULATION OF AVAILABLE FLOW FOR FIRE SPRINKLER LINE:

HYDRANT FLOW TEST 4 Dec 98
DATA: FLOW HYDRANT #D-12 (FLOW) & D-13 STATIC/RESIDUAL

STATIC PRESSURE (Ps)= 60

RESIDUAL PRESSURE (Pr)= 55

TEST FLOW (Qr)= 915

**CALCULATION FOR PEAK FLOW DEMAND (QP) FOR BKS BLDGS:**
Quad C (BKS: Bldg 356, 358)

QP = REQUIRED HYDRANT FLOW(QH) +
DOMESTIC FLOW(QD) + FIRE SPRINKLER FLOW(QF)

QH = 250 DURATION- 45 MINUTES - LIGHT HAZARD
Based on Pop of 602: OCCUPANCY PER MIL-HDBK-1008C
QD = 73 Extreme Peak based on BKS Pop of 600 (4x actual pop of bks)

QF = 700 700 GPM @ 35 psig (OR 400 GPM @ 44, SEE BELOW)

**QP = 1023 GPM @ 44 PSI (PER MECH SEC)**

**AVAILABLE PRESSURE AT RISER FOR 6" FIRE SPRINKLER LINE**

RESIDUAL PRESSURE AT TEST HYDRANT AT REQUIRED FLOW:

P = Ps - (Ps - Pr)(QP/Qr) ^ 1/0.54

**P = 53.85 PSI** > 35 PSI

ASSUME 12" MAIN SAME AS FHY FLOW

| ITEM | Q | LF MAX | Hf | | LOSSES FT | |
|---|---|---|---|---|---|---|
| 8" WATER LINE | 540 | 250 | 0.006 | = | 1.5 | LOOPED: USE HALF FLOW |
| 6" WATER LINE | 700 | 71 | 0.0354 | = | 2.513 | |
| TEE (20+7) | | 27 | 0.0354 | = | 0.956 | |
| PIV | | 10 | 0.0354 | = | 0.354 | |
| 2-VALVES (2X2.5) | | 5 | 0.0354 | = | 0.177 | |
| SUBTOTAL (LOSSES IN FT) | | | | | 5.5 | |
| LOSSES IN PSI | | | | | 2.384 | |
| DOUBLE CHECK VALVE LOSS | | | | | 3.10 | |
| | | TOTAL LOSSE= | | | 5.484 | |

**TOTAL AVAILABLE PRESSURE AT BLDG FOR SPRINKLER WATER SUPPLY:**

**P = 48.37 PSI > 35 PSI REQD OK**

## CALCULATION OF AVAILABLE FLOW FOR FIRE SPRINKLER LINE:

HYDRANT FLOW TEST 4 Dec 98

DATA: FLOW HYDRANT #D-12 (FLOW) & D-13 STATIC/RESIDUAL

STATIC PRESSURE (Ps)= 60

RESIDUAL PRESSURE (Pr)= 55

TEST FLOW (Qr)= 915

**CALCULATION FOR PEAK FLOW DEMAND (QP) FOR OFFICES/ADMIN:**

Quad C (COF/BN HQ: Bldg 355 & 357) WORST CASE BLDG 355 (3 MED COF, 1 LGE COF; 1 BN HQ

QP = REQUIRED HYDRANT FLOW(QH) +
DOMESTIC FLOW(QD) + FIRE SPRINKLER FLOW(QF)

QH = 500 DURATION- 45 MINUTES - --

Based on Pop of 602: LIGHT HAZARD OCCUPANCY PER MIL-HDBK-1008C

QD = 130 Extreme Peak based on FU (BLDG 355)

QF = 700 700 GPM @ 35 psig (OR 400 GPM @ 44, SEE BELOW)

**QP = 1330 GPM @ 44 PSI (PER MECH SEC)**

**AVAILABLE PRESSURE AT RISER FOR 6" FIRE SPRINKLER LINE**

RESIDUAL PRESSURE AT TEST HYDRANT AT REQUIRED FLOW:

P = Ps - (Ps - Pr)(QP/Qr) ^ 1/0.54

**P = 50.01 PSI** > 44 PSI

| ITEM | Q | LF MAX | Hf | | LOSSES FT | |
|---|---|---|---|---|---|---|
| 8" WATER LINE | 540 | 250 | 0.006 | = | 1.5 | LOOPED: USE HALF FLOW |
| 6" WATER LINE | 700 | 71 | 0.0354 | = | 2.513 | |

PRELIMINARY SOILS REPORT

# PRELIMINARY
## GEOTECHNICAL INVESTIGATION REPORT
## for
## FY03 MCA PN 52068 & BUP 52069.
## WBR, Brigade Complex, Phase 3A, Quad C
## Schofield Barracks, HI

**March 2003**

**1.0 PURPOSE AND SCOPE:** The primary purpose of this preliminary soils investigation report is to provide information concerning soils design for the project to potential bidders. This report will include recommendations regarding area grading, subgrade preparation, foundation design, and flexible pavement overlay design. A final soils report including investigations will be performed by the successful bidder and may revise or supercede information/recommendations included in this report. Data for this report was obtained from previous projects in the vicinity.

**2.0 GEOLOGIC DATA:**

**2.1 References:** "Geology of the State of Hawaii", Harold T. Stearns, 2nd edition, 1985, pages 59 and 115-116.

**2.2 Geology:** Schofield Barracks is located on the Schofield Plateau between the Waianae and Koolau Ranges. The Schofield Plateaus was formed by lava flows from the Koolau range stopping against the older Waianae range. Alluvium from the Waianae range also butts against and interfingers with the Koolau lavas on the western side of the plateau and along the rim of Kaukonahu Valley. The project area is generally underlain by thick deposits (approximately 50 to 60 feet) of fluvial and residual soils. The basalts in Hawaii slowly decompose by physical and chemical weathering into the red soils observed in road cuts. The weathering decreases with increasing depth below the ground surface. Near surface soil have been completely altered such that the soil has no characteristics of the original rock. Along deep road cuts along Kamehameha Highway near Schofield Barracks, Sterns (ref. 2.1.a.) observed approximately 10 feet of red soil overlying about 50 to 60 feet of decomposed basal in which the physical features of the parent basalt can still be observed.

Scattered boulders encountered within excavations are the result of the decomposition of basalt into "onion skin" boulders or spheroidally weathered basalt. Larger quantities of

basalt boulders and cobbles, if encountered, may be the fluvial deposits from the Waianae range.

**3.0 SUBSURFACE CONDITIONS.** Previous borings indicate the site is generally underlain by reddish brown with occasional tan and grayish-brown clayey silts (MH). These residual soils range in consistency from stiff to hard. Previous experience indicates occasional boulders will most likely be encountered within deeper excavations during construction. No groundwater was encountered to the maximum depth drilled.

**4.0 FOUNDATION DESIGN:**

**4.1 References.**

a. Army Technical Manual TM 5-818-1, "Soils and Geology: Procedures for Foundation Design of Buildings and Other Structures," October 1983.

**4.2 Discussion.** Based on the existing subsurface conditions, excavations can be accomplished using conventional earth moving equipment. A pneumatic hoe ram may be used to remove boulders that are larger than the utility trench width.

**4.3 Site Grading and Preparation.**

a. The ground surface where construction is proposed shall be completely cleared, stripped and grubbed to a depth sufficient to remove all pavements, slabs, appurtenances, vegetation, roots, and other debris. Grubbing and stripping should extend to a minimum depth of 6-inches. The stripped soils should be discarded or may be used as landscaping material with approval of the Contracting Officer. Surfaces to receive fill should be properly scarified, moisture conditioned to within 3% of optimum moisture and compacted to the specified density. Any soft areas that do not respond to the required compaction should be excavated to remove the soft material and backfilled with compacted satisfactory fill material.

b. All excavated in-situ residual soils free of deleterious matter and stones larger than 3 inches, may be used as satisfactory fill material. Excavated fill material should not be used as satisfactory fill material. **Imported** satisfactory fill material should consist of materials classified by ASTM D 2487 as GW, GP, GM, GC, SW, SP, SM, SC, ML, and MH. In addition, any imported material should have a liquid limit less than 60 and a plasticity index less than 30.

c. All fill materials (i.e., under building slabs or paved areas) should be moisture conditioned to within 3% of optimum moisture and compacted to a minimum 95% of

maximum density for cohesionless soils, and a minimum 90% of maximum density for cohesive soils, as determined by ASTM D 1557.

d. Satisfactory fill materials should be placed in 8-inch maximum loose lifts and compacted utilizing heavy compaction equipment. The loose lift thickness should be reduced to 6-inches when placed and compacted in confined areas, such as beneath or adjacent to footings, behind retaining walls or in utility trenches or when hand-tampers are used.

e. The finished grade from edge of building to 10 feet away should be sloped 5 percent to provide positive drainage away from foundations. If building roof runoff is intercepted with gutters and down spouts, the downspout should be long enough to discharge beyond the backfill limits of the buildings.

f. If footings are formed, the remaining annulus between the footing edge and excavation face should be wide enough to allow hand-held equipment to compact the backfill material. Excavation surfaces that become wet or muddy should be remediated by drying the excavation surface and recompacting or removing the wet material. Excavation surfaces that become dried out and cracked should be remediated by moisture conditioning and recompacting the surface.

**4.4 Shallow Foundations.** Based upon the N-values of the surface soils, the allowable bearing pressures for footings bearing on undisturbed clayey silt should be 2,500 psf. Allowable bearing pressures may be increased by one third for short term loading such as seismic or wind loads. The allowable bearing pressure may change based upon the results of the final soils report preparation. All footings should bear a minimum 18 inches below the lowest adjacent grade. Isolated and continuous footings should be at least 24-inches wide.

## 5.0 FLEXIBLE PAVEMENT OVERLAY DESIGN:

### 5.1 References.

A. Army Technical Manual TM 5-822-5, "Pavement Design for Roads, Streets, Walks, and Open Storage Areas", June 1992.

**5.2 Discussion.** For this preliminary soils report, the overlay will be assumed to be the same thickness as the removed material, 38 mm. The final design report will address anticipated vehicle traffic in its' overlay and pavement design.

### 5.3 Pavement Recommendations.

a. The asphalt concrete should meet State of Hawaii, Department of Transportation, Standard Specifications for Road and Bridge Construction, 1994; Mix No. IV; Aggregate absorption limited to maximum 5%; Asphalt cement PG 64-16 AASHTO MP 1. The asphalt pavement should be compacted to a minimum 91% of theoretical maximum density as determined by ASTM D 2041.

b. The base course should meet State of Hawaii, Department of Transportation, Standard Specifications for Road and Bridge Construction, 1994, 1-1/2 inch maximum size aggregate gradation. The base course should be compacted to 100% of maximum density as determined by ASTM D 1557.

c. The prime coat should meet ASTM D 2027 for MC-30 or MC-70 (cutback asphalt), and should be applied at a rate of 0.15 to 0.40 gallons per square yard. Prime coat should be placed on top of the compacted base course prior to placement of the surface course.

d. The tack coat should meet ASTM D 977 for SS-1 (emulsified asphalt), and should be applied at a rate of 0.05 to 0.20 gallons per square yard. Tack coat should be used to bond new asphalt pavement to any existing asphalt pavement or concrete structures (i.e., curb and gutters).

**6.0 POINT OF CONTACT**: For additional geotechnical design information or to discuss the recommendations in this report, please contact US Army Corps of Engineers, Pacific Ocean Division, Building 230, Fort Shafter, HI 96858, attention: Technical Support Branch, Raymond Kong (ph 808-438-6953).

SECTION 01012

# DESIGN AFTER AWARD

## 1.0 GENERAL

1.1 The Contractor shall propose a schedule for the number and composition of the design submittal phases. As a minimum, design submittals are required at the preliminary (50%), pre-final (90%) and final (100%). The requirements of each design stage are listed hereinafter. The Contractor shall reflect the number and schedules for the design submittals phases in the progress charts. As a maximum, the 50%, 90% and 100% shall be made into one consolidated package, which includes each of the fifteen (15) major categories listed in Paragraph, “Contents of Design Submittals,” except the foundation design, utilities under the slab (all utilities together as one submittal), the Building Interior Design, and long lead item submittals. These exceptions may be in addition to the 13 major submittals. More than one category may be combined in a submittal.

## 2.0 DESIGNER OF RECORD

The Contractor shall identify a Designer of Record ("DOR") for each area of design. All design disciplines shall be accounted for by listed, registered Designer(s) of Record. Each DOR shall be responsible for ensuring integrity of their design and design integration in all construction submittals and extensions to design developed by others, such as the constructor, subcontractors or suppliers. The DOR shall review and approve all construction submittals and extensions to design, in accordance with the procedures, described in Section 01330 SUBMITTALS. Each DOR shall be responsible for the responses to "Requests for Information" (RFI's), applicable to their area of design responsibility. Each DOR shall stamp, sign, and date all design drawings under their responsible discipline at each design submittal stage (see Contract clause - "REGISTRATION OF DESIGNERS") and all submittals under their responsible discipline, in accordance with the submittal review procedures. The DOR shall sign-off on all applicable RFI responses. "

## 3.0 DEFINITION OF DESIGN SUBMITTALS

3.1 **PRELIMINARY CONFORMANCE REVIEW SUBMITTAL (50%)**. The review of this submittal is primarily to insure that the contract documents and design analysis are proceeding in a timely manner and that the design criteria is being corrected interpreted. The submittal shall consist of the following:

1. Design Analysis, developed to 50%
2. 50% complete drawings
3. Outline Specifications
4. Environmental permits, as required. When environmental permits are not required, the Contractor shall provide a statement with justification to that effect.

3.2 **SITE/UTILITY DESIGN SUBMITTALS**. These submittals are provided to allow the contractor to concentrate initial efforts for the site/utility portions of the project. This submittal shall consist of the following:

3.2.1 Pre-final Design Site/Utility Submittal (90%), hard copies.

3.2.1.1 Design analysis, developed to 90%, site work and utility work only.

3.2.1.2 90% complete site/utility drawings

3.2.1.3 Draft specifications on all items of work submitted for Pre-final review shall consist of legible marked-up specification sections.

3.2.2 Final Design Site/Utility Submittal, 1st Backcheck (100%). Hard copies and CADD drawings.

3.2.3 Final Design Site/Utility Submittal. 2nd Backcheck (a second backcheck submittal will be made if all of the comments were not satisfactorily resolved in the 1st Backcheck submittal as determined by the Contracting Officer). Note that additional backchecks will be required until all of the comments have been satisfactorily resolved.

3.2.3.1 Design Analysis, in final 100% complete form.

3.2.3.2 100% complete drawings.

3.2.3.3 Final typed specifications.

3.2.3.4 Environmental permits. When environmental permits are not required, the Contractor shall provide a statement with justification to that effect.

3.2.3.5 Pre-final Design Site/Utility (90%) Submittal review comments and responses.

3.2.3.6 Electronic Submission: All CADD files in native MicroStation Version 8 or latest format, as well as all prepared technical specifications shall be provided on CD-ROM. Two copies are required.

3.3 **PRE-FINAL BUILDING DESIGN SUBMITTAL (90%).** Hard copies and CADD drawings. The review of this submittal is to insure that the design is in accordance with directions provided the Contractor during the design process as well as the 50% submittal. The Contractor shall submit the following documents for Pre-final Design Review:

3.3.1 Design Analysis. The Design Analysis submitted for pre-final Design Review shall be in its final form. The Design Analysis shall include all backup material previously submitted and revised as necessary. All design calculations shall be included. The Design Analysis shall contain all explanatory material giving the design rationale for any design decisions, which would not be obvious to an engineer reviewing the Final Drawings and Specifications.

3.3.2 Drawings. The Contract Drawings submitted for pre-final Design Review shall include the drawings previously submitted which have been revised and completed as necessary. The Contractor is expected to have completed all of his coordination checks and have the drawings in a design complete condition. The drawings shall be complete at this time including the incorporation of any design review comments generated by the previous design review. The drawings shall contain all the details necessary to assure a clear understanding of the work throughout construction. Shop drawings will not be considered as design drawings. All design shall be shown on design drawings prior to submittal of shop drawings.

3.3.3 Specifications. The Draft Specifications on all items of work submitted for pre-final Design Review shall consist of legible marked-up specification sections.

3.3.4 Other Information. Site Utility design information need not be included in this submittal package except where interface to the interior building systems is required.

3.4 **FINAL BUILDING DESIGN SUBMITTAL 1ST BACKCHECK (100%)**. After the pre-final Design Review, the Contractor shall revise the Contract Documents by incorporating any comments generated during the pre-final Design Review and shall prepare final hard copy Contract Specifications. The Contractor shall submit the following documents for the design complete submittal:

3.4.1 Design Analysis. In final 100% complete form.

3.4.2 Drawings. In final, 100% complete drawings.

3.4.3 Specifications. In final, 100% complete specifications

3.4.4 Annotated Review Comments. Final review comments and responses.

3.4.5 Electronic Submission. All CADD files in native MicroStation Version 8 or latest format, as well as all prepared technical specifications shall be provided on CD-ROM. Two copies are required.

3.5 Final Design Site/Utility Submittal. 2nd Backcheck (a second backcheck submittal will be made if all of the comments were not satisfactorily resolved in the 1st Backcheck submittal as determined by the Contracting Officer). Note that additional backchecks will be required until all of the comments have been satisfactorily resolved.

3.6 **COMPREHENSIVE INTERIOR DESIGN**

3.6.1 Definition. The Comprehensive Interior Design (CID) shall involve the selection and sampling of all applied finishes including material, color, texture and patterns necessary to complete the building's interior architectural features. The CID shall meet all requirements addressed in SOW CH 14, Comprehensive Interior Design.

3.6.2 Samples. Present architectural finish samples in orderly arrangements according to like rooms/areas receiving like finish. Each like room receiving like finishes will be noted as a Color Scheme. Each Color Scheme shall have a written description of material used. This written description shall use the same material abbreviations and notes that appear on the Room Finish Schedule and Legend in the contract drawings. Present pre-wired workstation finishes on a color board separate from the architectural finishes. Submit the CID binders concurrently with the architectural design submittals.

3.6.3 Preliminary Submittals. The Contractor shall submit three complete sets of the initial CID package. The design philosophy shall use a warm neutral background color with appropriate accent colors. All CID proposals shall be reviewed and approved by the Government. The Interior Designer shall revise the CID binders after each review and update the CID to satisfy review comments. Each submittal will follow this method of review until the Government approves the completed CID package.

3.6.4 Government Approval. Government approval will be sought from the Honolulu Engineer District, which is the District Authority Having Jurisdiction (DAHJ). The DAHJ will be consulted for all interpretations of Comprehensive Interior Design (CID) to be used in this project through the Contracting Officer. The Contractor shall direct all questions, interpretations and clarifications to the Contracting Officer. All requests for information by the Contractor shall be submitted to the Contracting Officer in writing with the appropriate sketches, basis for waiver, specific question and any other information deemed necessary by the DAHJ. In general, a minimum of seven (7) calendar days is required by the DAHJ to respond to all inquiries. The seven days will start from the day of receipt by the Contracting Officer. In the event interpretation or approval is required from HQUSACE, an additional seven (7) calendar days will normally be required.

3.6.5 Final Submittal. After approval of the Preliminary Submittal, the Contractor shall submit three (3) complete sets of the approved and final Comprehensive Interior Design package. Once the Contractor has submitted the CID and the Government has approved the submittal, all materials, finishes, colors, textures and pattern submitted and approved for this project are then considered as part of the contract and the Contractor shall furnish all approved CID finishes. No deviations will be considered.

3.6.6 Format. Submit all CID information and samples on 8 1/2"x 11" modules. Place the project title, base, architectural firm, page number and date on the bottom of each page or module.

3.6.6.1 The module shall support and anchor all samples. Anchor large or heavy samples with mechanical fasteners, Velcro, double-sided foam tape or contact cement. Rubber cement or glue will not be acceptable.

3.6.6.2 Assemble the 8 1/2" x 11" pages and modules in a 3" D-ring binder. Holes for placement of the modules in the binder shall be 3/8" in diameter. Each binder shall be identified on the outside spine and front cover by title, project number, percentage phase and date.

3.6.6.3 Material and finish samples shall indicate true pattern, color and texture.

3.6.6.4 Where paint manufacturers color names and numbers are used indicated the finish of the paint such as gloss, semi-gloss, flat and so on.

3.6.6.5 Signage may include emblems, striping, letters, numbers and logos. The interior designer shall consider visual appearance, organization, location, structural supports (if required) and relation to other base graphics. Indicate on a separate signage sheet the location and message for all signage. Submit a sample of the signage material finish and color with the structural finishes.

3.6.6.6 No photographs or colored photocopies of materials will be accepted or approved.

3.6.7 CID Binder. The CID Binder shall include the following information at each design submittal in this order:

==========

**SEQUENCE OF CID SUBMITTAL**

1. Title page

2. Table of contents

3. Design objectives - A statement of design objectives explaining the interior design philosophy of the facility shall be provided in the CID. Design objectives and the proposed method of accomplishing the objectives. Shall cover, when applicable, energy efficiency, safety, health, maintenance, image, personal performance of occupants and functional flexibility.

4. Interior floor plan

5. Interior sample finish boards

   Scheme A
   Scheme B
   Scheme C

Example all restrooms could be noted as color scheme "A", all general open office finishes could be noted as color scheme "B" and the main lobby could be noted as color scheme "C".

6. Room finish schedule

7. Signage

8. Signage plan

9. Pre-wired workstation composite floor plans

10. Pre-wired workstation typical - elevations and component inventory.

11. Pre-wired workstation panel identification plan with electrical outlet placement including base feed.

12. Plan must show suitability of proposed space to suit the furniture to be provided.

==========

4.0 QUANTITY OF DESIGN SUBMITTALS

4.1 General. The documents, which the Contractor shall submit to the Government for each submittal, are listed and generally described hereinafter.

DISTRIBUTION

| Activity and Address | Drawing Size <Full> | Drawing Size <Half> | Color Boards** |
|---|---|---|---|
| U.S. Army Corp. of Engineers<br>Honolulu Engineering District<br>Bldg. 230, Room 318<br>Ft. Shafter, HI 96858<br>Attn: CEPOH-PP-A / Kenneth Cabalce | 14 | 2 | 2 |
| Director of Public Works<br>U.S. Army Garrison, Hawaii<br>Attn: Michael Kumabe<br>WAAF, Schofield Barracks, HI 96857-5013 | 5 | | 1 |
| 3rd Brigade Commander<br>Address ?<br>Schofield Barracks, HI | 2 | | 1 |
| | | | |

** Color boards shall be submitted with the 100% building submittal only.

5.0 MAILING OF DESIGN SUBMITTALS

5.1 General. Mail all design submittals to the Government during design and construction, using an overnight mailing service. The Government will furnish the Contractor addresses where each copy shall be mailed to after award of the contract. The submittals shall be mailed to the addresses listed in para. 4.1 Distribution.

5.2 Transmittal Letter. Each design submittal shall have a transmittal letter accompanying it indicating the date, design percentage, type of submittal, list of items submitted, transmittal number and point of contact with telephone number.

6.0 COORDINATION

6.1 Written Records. The Contractor shall prepare a written record of each design site visit, meeting, or conference, either telephonic or personal, and furnish within five (5) working days copies to the Contracting Officer and all parties involved. The written record shall include subject, names of participants, outline of discussion, and recommendation or conclusions. Number each written record for the particular project under design in consecutive order.

6.2 Design Needs List. Throughout the life of his contract the Contractor shall furnish the COR a monthly "needs" list for design related items. This list shall itemize in an orderly fashion design data required by the Contractor to advance the design in a timely manner. Each list shall include a

sequence number, description of action item, name of the individual or agency responsible for satisfying the action item and remarks. The list will be maintained on a continuous basis with satisfied action items checked off and new action items added as required. Once a request for information is initiated, that item shall remain on the list until the requested information has been furnished or otherwise resolved. Copies of the list will be mailed to both the Administrative Contracting Officer and the agencies tasked with supplying the information.

7.0 GOVERNMENT REVIEW

7.1 Design Schedule. Within 30 days **after Notice** to Proceed, the Contractor shall submit, for approval, a complete design schedule with all submittals and review times indicated in calendar dates. The Contractor shall update this schedule monthly. No design submittals will be reviewed or evaluated until after receipt and acceptance of the proposed design/review schedule.

7.2 Government Review Period. After receipt, the Government will be allowed thirty (30) calendar days to review and comment on each design submittal. For each design review submittal, the Administrative Contracting Officer (ACO) will furnish, to the Contractor, a single consolidated listing of all comments from the various reviewers and from others concerned agencies involved in the review process. The review will be for conformance with the technical requirements of the solicitation and the Successful Offeror's (Contractor's) RFP proposal. If the Contractor disagrees technically with any comment or comments and does not intend to comply with the comment, he must clearly outline, with ample justification, the reasons for noncompliance within seven (7) calendar days after receipt of these comments in order that the comment can be resolved. The Contractor shall furnish disposition of all comments, in writing, with the next scheduled submittal. The Contractor is cautioned in that if he believes the action required by any comment exceeds the requirements of this contract, that he should take no action and notify the COR in writing immediately. Review conferences will be held for each design submittal at (Fort Shafter ). The Contractor shall bring the personnel that developed the design submittal to the review conference. These conferences will take place the week after the receipt of the comments by the Contractor.

7.3 Post review conference action. Copies of comments, annotated with comment action agreed on, will be made available to all parties before the conference adjourns. Unresolved problems will be resolved by immediate follow-on action at the end of conferences. Valid comments will be incorporated. After receipt of final (100%) corrected site/utility and building design documents upon incorporation of backcheck comments the contractor may proceed with site and building development activities within the parameters set forth in the contract and accepted design submittal. The Government, however, reserves the right to disapprove design document submittals if comments are significant (in the opinion of the Government, it does not comply with the contract documents nor the level of quality implied). If pre-final or final submittal(s) are incomplete or deficient, and require correction by the Contractor and re-submittal for review, the cost of rehandling and reviewing will be deducted from payment due the Contractor at the rate of $ 5,000.00 per submittal.

8.0 DESIGN ANALYSIS

8.1 Media and Format. Present the design analysis on 8-1/2-inch by 11-inch paper except that larger sheets may be used when required for graphs or other special calculation forms. All sheets shall be in reproducible form. The material may be typewritten, hand lettered, handwritten, or a combination thereof, provided it is legible. Side margins shall be 1-inch minimum to permit side binding and head to head printing. Bottom margins shall be 1-1/4-inches, with page numbers centered 1 inch from the bottom.

8.2 Organization. Assign the several parts and sheets of the design analysis a sequential binding number and bind them under a cover indicating the name of the facility and project number, if applicable. The title page shall carry the designation of the submittal being made. The complete design analysis presented for final review with the final drawings and specifications shall carry the designation "FINAL DESIGN ANALYSIS" on the title page.

8.3 Design Calculations. Design calculations are a part of the design analysis. When they are voluminous, bind them separately from the narrative part of the design analysis. Present the design calculations in a clean and legible form incorporating a title page and index for each volume. Furnish a table of contents, which shall be an index of the indices, when there is more than one volume. Identify the source of loading conditions, supplementary sketches, graphs, formulae, and references. Explain all assumptions and conclusions. Calculation sheets shall carry the names or initials of the author and the checker and the dates of calculations and checking. No portion of the calculations shall be computed and checked by the same person.

8.4 Automatic Data Processing Systems (ADPS). When ADPS are used to perform design calculations, the design analysis shall include descriptions of the computer programs used and copies of the ADPS input data and output summaries. When the computer output is large, it may be divided into volumes at logical division points. Precede each set of computer printouts by an index and by a description of the computation performed. If several sets of computations are submitted, a general table of contents in addition to the individual indices shall accompany them. Preparation of the description, which must accompany each set of ADPS printouts, shall include the following:

1. Explain the design method, including assumptions, theories, and formulae.
2. Include applicable diagrams, adequately identified.
3. State exactly the computation performed by the computer.
4. Provide all necessary explanations of the computer printout format, symbols, and abbreviations.
5. Use adequate and consistent notation.
6. Provide sufficient information to permit manual checks of the results.

9.0 DRAWINGS

9.1 General. Prepare all drawings on Computer-Aided Design and Drafting (CADD) so that they are well-arranged and placed for ready reference and so that they present complete information. The Contractor shall prepare the drawings with the expectation that the Corps of Engineers, in the role of supervision, will be able to construct the facility without any additional assistance from the Contractor. Drawings shall be complete, unnecessary work such as duplicate views, notes and lettering, and repetition of details shall not be permitted. Do not show standard details not applicable to the project, and minimize unnecessary wasted space. Do not include details of standard products or items, which are adequately covered by specifications on the drawings. Each Design Discipline shall provide a complete list of abbreviations and symbols used in their respective drawings. Detail the drawings such that conformance with the RFP can be checked and to the extent that shop drawings can be checked. Do not use shop drawings as design drawings. The design documents shall consist of drawings on a 36" x 24" format. The Contractor shall use standard Corps of Engineers title blocks and borders on all drawings. Submit an index of drawings with each submittal. The COR will furnish the Contractor file, drawing, and specification numbers for inclusion in the title blocks of the drawings.

9.2 Methods and Format. Create all drawings using CADD methods in MicroStation format. Save all Design Complete CADD files as MicroStation 8.0 or latest. The Contractor shall use EM 1110-1-1807 Standards Manual for U.S. Army Corps of Engineers Computer-Aided Design and Drafting (CADD) Systems as guidance to for standard details, cell libraries, title blocks, and layer/level assignments. Drawing features not addressed in EM 1110-1-1807 shall conform to drafting standards.

9.3 Use of Standard Fonts. Only standard fonts provided by MicroStation shall be used in the creation of CADD files. No fonts created by third parties or the designers are permitted.

9.4. Use of Reference Files. The uses of Reference files and Xrefs during the design stage are up to the discretion of the designers. All CADD files at Design Complete submittal shall be free standing, independent files, and not supported by reference files. All Reference files (MicroStation) shall be removed at Design Complete submittal.

9.5 Submittal Media. Submit all Design Complete CADD files on the following media.

-Read/Write CD-ROM Disk

10.0 SPECIFICATIONS

10.1 General. The Contractor shall submit marked-up and final specifications as required. The specifications may be any one of the major, well known master guide specification sources such as MASTERSPEC from the American Institute of Architects, SPECTEXT from Construction Specification Institute or Unified Facilities Guide Specifications (UFGS), etc. unless otherwise required. Use only one source for the project unless otherwise required. Edit the specifications for this project and submit in marked-up or redlined draft version at the Pre-Final Review submittal stage. If the design is based on a specific product, the specification shall consist of the important features of the product. The specification shall be detailed enough such that another product meeting the specification could be substituted and it would not adversely impact the project. After incorporation of comments, submit a final, design complete specification package. Delete all marked-out or redlined text and type in all inserted text.

10.2 Submittal Register. Develop the submittal requirements during construction during the design phase of the contract, by producing a Contractor Submittal Register during design. Attach a submittal register to each section of the specifications for the submittal requirements of that section. Prepare the Submittal Register on ENG Form 4288. The Contractor shall be responsible for listing all required submittals necessary to insure the project requirements are complied with. The Register shall identify submittal items such as shop drawings, manufacturer's literature, certificates of compliance, material samples, guarantees, test results, etc that the Contractor shall submit for review and/or approval action during the life of the construction contract. The Contractor shall place all the Submittal Register pages in an appendix of the final specifications.

**11. CONTENTS OF 50% DESIGN SUBMITTALS**

The 50% design submittals shall contain as a minimum, the following:

11.1 Paving, Grading and Drainage

11.1.1 Explanation of objectives and factors influencing siting decisions.
General overview of major site features planned, such as building orientation, drainage patterns, parking provisions, traffic circulation, provisions for the handicapped, security requirements, etc. Rationale for locating major site elements. Set back requirements or specific clearance requirements. Locations of borrow and spoil areas.

11.1.2 Requirements for flood protection. Selected storm drainage plan with respect to existing storm drainage system. Alternate schemes considered in arriving at selected plan. Disposition of storm water collected in the new system. Planned connections to the existing storm drainage system. Handling of roof runoff. Features and locations of special drainage structures. Types of materials to be specified for each installation. Selected design values to be used in the storm drainage calculations such as surface runoff coefficient, retardance coefficient, infiltration rate, and rainfall intensity based on a 10-year storm frequency. Design flood frequency and minimum elevation to provide flood protection. Planned finished floor elevations.

11.1.3 Slope stability analysis (cut and fill) and justification for any slopes steeper than 3:1 for cohesive soils and 4:1 for cohesionless soils.

11.1.4 Pavement design analysis shall include design method and all pertinent data including traffic types, volumes, soils data and any other data used to design the pavement structures. Flexible Pavements--required thickness of base and pavement based on the pavement design and

established subgrade CBR. Rigid Pavements--required thickness of nonreinforced concrete pavement and the established modulus of subgrade reaction.

11.1.5 Traffic volume and type. Particular AASHTO design vehicles for which turning movements are to be provided for and corresponding minimum turning radius.

11.1.6 Requirements for curbs, sidewalks, guardrails, traffic signs, markings, fencing, etc. Intersections or connections to existing roads and streets. Traffic routing during construction.

11.1.7 Site plan (geometry) and grading and drainage plan.

11.1.8 An overall site plan on one drawing showing all paving, grading and drainage.

11.1.9 Permit applications.

11.2 Geotechnical. A geotechnical report and design analysis.

11.3 Water Supply and Sanitary Sewage.

11.3.1 Design narrative and design calculations for the water supply and wastewater systems relating to this project. Include an analysis of the existing water distribution system capability to supply sufficient quantity at adequate pressures for fire protection. If the existing water distribution system is inadequate, provide the design solution to augment the water supply to meet the fire protection requirements. Design for wastewater systems shall show sewage flows, pipe sizes, routing, elevations, pump type and capacities, wet well sizing, etc. The Contractor shall present an analysis presenting proposed corrections of deficiencies or confirming the adequacy of the existing water supply system to support the proposed building.

11.3.2 Drawings developed to the point of showing in plan the anticipated systems and layout. Rough details of pumping systems or other features requiring detail drawings.

11.3.3 Anticipated permit requirements for water and wastewater features.

11.3.4 Lawn and Landscaping Irrigation System.
The design submittal shall include drawings clearly showing the piping layout and location of sprinkler heads coordinated with the landscaping plan, control valves, backflow preventers, rain check switches, controllers, etc. Indicate buildings, walks, shrubbery, trees, and other obstacles that might interfere with the proper operation of the sprinkler system. A design analysis calculating the pressures at each sprinkler head for the capacity and radius of throw is required. Details of the sprinkler head installation, valve boxes, and other irrigation appurtenances shall be submitted.

11.4 Landscape, Planting and Turfing.

11.4.1 The landscape planting design narrative shall describe the analysis of existing site conditions, including an indication of existing plant materials that are to remain on the site. The statement of concept shall indicate specific site problems related to proposed development and the rationale for proposed plant locations. The narrative shall also include a list of suggested types and sizes of plant materials which are to be used, based upon the designated functional and visual criteria.

11.4.2 The concept drawings shall be prepared at a scale which corresponds with the site layout and grading plans and, likewise, shall include reference coordinates, north arrows, graphic scales and appropriate legends. An overall planting layout shall be developed and shall include enlarged detail plans of specific areas, as needed, to clarify requirements. The proposed layout shall indicate shade trees, evergreen trees, flowering trees, shrub masses, etc., according to designated functional and visual locations of planting. A legend which also indicates sizes of plants recommended for each of the above categories shall be included. The drawings and all subsequent plans shall indicate existing and

proposed buildings, paved areas, signs, light standards, transformers, dumpster areas, storm drainage system, and other structures and utilities.

11.5 Architectural

11.5.1 Design narrative shall provide a summary of functional space relationships, as well as circulation. There shall also be a general statement for the rationale behind the major design decisions.

11.5.2 Plans shall indicate dimensions, columns lines, and detail references. Toilets and other specialized areas shall be drawn to ¼" scale and shall show any needed interior features.

11.5.3 Finish schedule shall indicate material, finishes, colors and any special interior design features such as soffits, fascias, and lighting troughs, etc.

11.5.4 All required equipment shall be shown on the drawings with an equipment list.

11.5.5 List any special graphics requirements that will be provided.

11.5.6 Schedules shall be provided for both doors and windows. These schedules shall indicate sizes, types, and details for all items shown on floor plans.

11.5.7 Hardware sets using Builders Hardware Manufacturers Association Inc. (BHMA) designations.

11.5.8 Composite floor plan showing all prewired workstations or kitchen equipment. Also show typical elevations of each type of workstation or equipment.

11.5.9 Comprehensive Interior Design (CID) package.

11.5.10 List all references used in the design including but not limited to Government design documents and industry standards.

11.5.11 Specifications: The architectural work for the project shall be constructed in accordance with Unified Facilities Guide Specifications (UFGS). Edited UFGS specification sections shall clearly indicate design intent including products and execution to be provided.

11.6. Structural Design.

11.6.1 State the live loads to be used for design. Include roof and floor loads; wind loads, lateral earth pressure loads, seismic loads, etc., as applicable.

11.6.2 Describe the method of providing lateral stability for the structural system to meet seismic and wind load requirements. Include sufficient calculations to verify the adequacy of the method.

11.6.3 Furnish calculations for all principal roof, floor, and foundation members.

11.6.4 This submittal shall include drawings showing roof and floor framing plans as applicable. Principal members will be shown on the plans. A foundation plan shall also be furnished showing main footings and grade beams where applicable. Where beam, column, and footing schedules are used, show schedules and fill in sufficient items to indicate method to be used. Typical sections shall be furnished for roof, floor, and foundation conditions. Structural drawings for proposals and submittals shall be separate from architectural drawings.

11.6.5 Provide any computer analyses used shall be widely accepted, commercially available programs or complete documentation.

11.6.6 Antiterrorism/Force Protection (AT/FP) and Seismic Evaluation and Rehabilitation. The design analysis provided in the proposal submission shall be further developed. Complete the Government-furnished designs on AT/FP and seismic hazards mitigation, and provide detailed drawings reflecting the completed designs. Designs shall be stamped by a structural engineer licensed in the U.S.

11.6.7 A narrative description and supporting calculations shall show structural adequacy of existing structure to support new live loads. If existing floor systems will require strengthening to maintain structural integrity, provide an analysis and complete and detailed drawings showing the work.

11.7 Specific Mechanical and Plumbing Requirements:

11.7.1 List all references used in the design including Government design documents and industry standards.

11.7.2 Provide justification and brief description of the types of equipment, fixtures and piping materials proposed for use. Descriptions shall include narrative and catalog cuts.

11.7.3 Prepare detail calculations for systems such as sizing of air conditioning systems, heat recovery system, gas hot water heater and piping, and storage tanks.

11.7.3.1 Include computations for sizing equipment, air duct design, and U-factors for ceilings, roofs and exterior walls and floors. Contractor shall employ commercially available energy analysis techniques to determine the energy performance of all passive systems and features. Use of hourly energy load computer simulation (e.g., HAP, Trace, TRNSYS, DOE 2.1 Blast, etc.) is required. These calculations can be used to size the mechanical systems. Based on the results of calculations, provide a complete list of the materials and equipment proposed for heating and plumbing, with the manufacturer's published cataloged product installation specifications and roughing-in data. The heating and cooling equipment data shall include the manufacturer's wiring diagrams, installation specifications, ARI certification, and the standard warranty for the equipment.

11.7.4 include drawings of all areas including air conditioning, hot water, cold water, waste and vent piping. Drawings shall include plans, sections, piping isometric diagrams, control diagrams, DDC points list, sequence of operation, schedules and details. Minimum of 1:100 scale shall be used on all plan drawings, and building sections. Detailed drawings shall be minimum 1:50 scale. Detailed drawings shall be provided for all mechanical spaces including, but not limited to, toilet areas, mechanical rooms, chiller plant, hot water plant and fire pump building. Minimum drawing requirements are as follows:

Room designations.
Mechanical legend and applicable notes.
Location of all ductwork or piping
Location and capacity of all terminal units (i.e., registers, diffusers, grilles, variable air volume boxes).
Exhaust fan and range hood location.
Size of all ductwork 400 mm (16 in.) or larger in any dimension and piping 100 mm (4 in.) or larger
Location of heating/cooling plant (i.e., boiler, chiller, cooling tower, etc).
Location of all air handling equipment.
Return air paths (i.e., undercut doors, transfer grilles).
Flue piping size and location.
Fixture schedule and designations
Location of utility entrances.
Waste and water pipe location and size.
Details of any building penetration (i.e. louvers, penthouses, powered roof ventilators, vents, etc.)

11.7.4.1 Equipment Schedule: Complete equipment Schedules shall be provided. Schedule shall include at minimum:

Capacity
Electrical characteristics
Efficiency (if applicable)
Manufacturer's name
Optional features to be provided
Physical size
Weight

11.7.6 Specifications: The mechanical and plumbing work for the project shall be constructed in accordance with Unified Facilities Guide Specifications (UFGS). Edited UFGS specification sections shall clearly indicate design intent including products and execution to be provided.

11.8 Fire Protection

11.8.1 Design documents: All Fire Protection Design documents shall be in accordance with ER 1110-345-700 and are required to be submitted for approval prior to start of construction. Fire protection symbols in NFPA 170 shall be used. See Scope of work, Chapter 12 for acronym definitions used in this paragraph.

11.8.2 Fire Protection Analysis is required to be submitted in accordance with UFC 1-200-01 and UFC 3-600-1. Requirement must be stated with what is being provided in the project to meet this requirement. Include proposal submittal and the following: Hydraulic analysis and node sketch for all sprinkler systems to be installed in all buildings in accordance with FSC and UFC. Calculations confirming the adequacy of the existing water supply shall be provided. Hydrant flow test is required and flow data shall be submitted. Hydrant flow test shall be performed with the Schofield Barracks Water Treatment Plant clearwell pumps off. Calculations for any fire pump and tank shall be provided. Locations of all fire pumps and tanks shall be shown. All IBC allowable area, allowable height, construction type to be used and location on property requirements shall be submitted. Fire alarm system type (addressable) to be discussed. Discussion of all the life safety requirements of LSC shall be included.

11.8.3 Fire Protection Drawings:

11.8.3.1 General: Minimum of 1:100 scale shall be used on all plan drawings, and building sections. Drawings shall show fire alarm systems, sprinkler system and life safety requirements (fire barriers, exits, etc.). Detail drawings shall be minimum 1:50 scale. Minimum drawing requirements are as follows:

11.8.3.2 Automatic Fire Sprinkler system: Sprinkler head plans, attic plans, building sections, sprinkler riser with shutoff valve and tamper switch, alarm check valve, preaction/deluge valve, local alarm gong, flow/pressure switch, wall penetrations, fire rated wall penetrations, fire department connection locations, and sprinkler design parameters (occupancy hazard for each room, minimum sprinkler density to be used for each occupancy hazard, minimum design area, most hydraulically remote area, sprinklered areas). Detail fire pump plans, sections, isometric diagram of the fire pump system, tank plans, tank sections, tank details and piping layout and details.

11.8.3.3 Fire alarm system: Plans showing location of all initiation devices (manual pull stations, duct smoke detectors, sprinkler flow switches, smoke detectors, magnetic door holders), visible/audible notification appliances, supervisory devices (tamper switches, low pressure switches), fire alarm panel, fire alarm exterior annunciator, and fire alarm diagram.

11.8.3.4 Life Safety: All fire rated walls shall be shown where they begin and where they end. All fire rated shafts, stairs, vertical openings, seismic joints shall be shown. Fire rated doors, fire rated door frames, fire rated windows and window frames, door hardware, fire dampers, and smoke dampers are to be shown with the appropriate fire rating in hours.

11.8.3.5 IBC requirements: Site plan showing the location of the project buildings in relation to other existing buildings, roads, parking lots, fuel tanks, water tanks, electric poles, exterior power lines.

11.8.3.6 Means of egress lighting and LED type exit signs meeting LSC shall be shown on the plans.

11.8.4 Specifications.

11.8.4.1 General requirements: The fire protection work for the project shall be constructed in accordance with Unified Facilities Guide Specifications (UFGS) sections 13920 Fire Pumps, 13930 Wet Pipe Sprinkler System, Fire Protection, 13945 Preaction/Deluge Sprinkler System, Fire Protection, 13851 Fire Detection and Alarm System Addressable, and 7840 Firestopping. Edited UFGS specification sections shall be used and revised in accordance with the restrictions in ER 1110-345-700, Appendix D and the following:

11.8.4.2 Sprinkler systems: No plastic piping or fittings, and “T drill method” are allowed. Sprinkler system design area, density and hydrant demand shown in 1008C shall be followed. Sway bracing and branch restraints are required. Government Shop drawing submittal approval and preparer approval is required.

11.8.4.3 Fire alarm systems: Class A looped fire alarm system is required. “T taps” are prohibited. Fire Protection Engineer qualification approval, Fire Protection Engineer shop drawing approval and fire alarm shop drawing submittal approval by the Government are required. Modify the operations paragraph to meet the Attachment Fire Alarm Control Matrix control sequence.

11.8.4.4 Firestopping, fire dampers, fire rated doors/door frames, smoke dampers, and exit signs, must be submitted for Government approval.

11.9 Interior Electrical System

11.9.1 The power riser or one-line diagram shall be essentially complete except for finalization of conduit and wire sizes.

11.9.2 Panelboards, switchboards, switchgear, motor control centers, and all other utilization equipment shall be located on the floor plans. Schedules for applicable equipment shall be provided. The schedules shall include all pertinent information to fully describe the equipment. Elevations for free standing equipment shall be provided but need not be entirely finalized.

11.9.3 Details of the layouts for electrical closets and rooms shall be shown.

11.9.4 Receptacles and light fixture layouts (wiring not required at this stage) shall be shown for all rooms.

11.9.5 Areas where nonlinear loads will be encountered shall be identified. Per the requirements of paragraphs 4c and 4g of ETL 1110-3-403, the use of 75 degree C. (minimum) conductors is required. Branch circuits serving eight-wire systems furniture or groups of nonlinear loads shall be 3#12, 1#10 N., 1#12 GND. and 1#12 Isolated GND. Feeders serving panelboards with nonlinear loads shall have the neutral conductor ampacity based on at least 1.73 times the ampacity of the phase conductors. The neutral bus in the panelboards shall have the same criteria. The simplest way to accomplish the upsizing of the neutral conductor is to provide double ampacity neutrals or parallel conductors in sizes permitted by the National Electrical Code.

11.9.6 A completed fixture schedule shall be included on the drawings.

11.9.7 All removals shall be shown on demolition plans.

11.9.8 Describe energy conservation measures and/or techniques that are being incorporated into

the design.

11.10 Exterior Electrical Distribution System

11.10.1 In a narrative, clearly describe the electrical distribution system and state the changes to be made to the existing system to accommodate this project. State any deficiencies to be corrected and provide a description of all new work being performed.

11.10.2 State the electrical characteristics of the power supply from the service point to the main service equipment.

11.10.3 Indicate the type, number, voltage rating and connections, and kVA rating of all transformers provided.

11.10.4 State the type of conductor to be used and provide a justification for its use.

11.10.5 Include a statement describing the criteria used for the exterior design such as primary and secondary voltage drop. Describe the physical characteristics of both the underground and overhead power lines. Provide the short circuit current available at the site and state the source of this value.

11.10.6 Include a description of all exterior lighting systems included in the design. Identify the fixture types, poles and design lighting levels. Provide point-to-point calculations showing that all design levels have been achieved.

11.10.7 All of the exterior electrical design drawings shall show all poles (lighting), underground conductors, manholes, handholes, ductbanks, and all pertinent components identified on the site plans. Details shall include but not limited to poles, manholes, handholes, ductbanks, etc. Calculations shall support all new manhole and handhole locations.

11.10.8 All removals shall be shown on demolition plans.

11.11. Electronic Systems

Public Address System
Telecommunications System
Cable Television System
Intrusion Detection
Personal Alert (Mass Notification) System

Provide a descriptive narrative of all electronic systems that are required for this project. The design analysis shall include all calculations required to support design decisions and estimates at this stage of design. The analysis shall include specific criteria furnished, conference minutes and cost analyses of all systems considered.

11.11.1. Show location of telecommunications outlets (including pay phones) on the plans. Include legend and symbol definition to indicate height above finished floor. Show a Telecommunication Conduit System Riser Diagram.

11.11.2. Verification of the validity of any existing drawings and/or any other data furnished by the Government shall be the responsibility of the engineering services firm.

11.11.3. Provide a statement describing the extent of any exterior work such as telecommunication lines, cable television (TV) distribution cables, duct banks, etc., outside of 5 feet from the building line.

11.11.4. Exterior work to be shown on electrical site plan:

Existing and new telecommunications and cable television service lines, both overhead and underground, shall be properly identified.
Show removals and relocations, if any.

11.11.5. Show the location of all electronic system panels, devices, outlets, etc., on the floor plans. Show the proposed riser diagrams for all systems. Show typical sizes of all conduit, wires, cables, panels, etc. Provide a complete symbol legend for all devices or equipment shown on the plans. For work requiring removals or demolition, the designer shall show by use of drawings or narrative, how demolition work is to be done.

11.12. Submit outline specifications unless otherwise indicated above.

11.13. Submit the SPIRIT rating sheet for sustainable level compliance as indicated in the SOW.

**13.0 CONTENTS OF OTHER DESIGN SUBMITTALS**

13.1 The 90% pre-final site/utility design submittal shall contain as a minimum, the following:

13.1.1 General Narratives:

13.1.1.1 Site/Layout: Explanation of objectives and factors influencing siting decisions. General overview of major site features planned, such as building orientation, drainage patterns, parking provisions, traffic circulation, provisions for the handicapped, security requirements, etc. Rationale for locating major site elements. Set back requirements or specific clearance requirements. Locations of borrow and spoil areas.

13.1.1.2 Utility Systems: Design narrative for the water supply, storm drainage, wastewater, electrical, and telecommunications systems relating to this project. Include an analysis of the existing distribution systems capability to supply sufficient quantity at adequate levels. If the existing distribution systems are inadequate, provide the design solution to augment the systems to provide the requirements for the new facilities.

13.1.2 All drawings included in the required technical data for the proposal submission (see SECTION 01010: STATEMENT OF WORK), shall be developed to 90 percent completion. In addition to the individual utility plans, submit a combined utility plan drawn to the same scale as the individual utility plans.

13.1.2.1 General Site Layout: Label and tie down locations of new site elements (buildings, walks, curbs, new pavements surfaces, gutters, parking, trash enclosures, bicycle racks, etc.) Scale shall be included.

13.1.2.2 Site Grading and Drainage Plans: Show locations of all sediment basins, diversion ditches, and other erosion control structures. Indicate the approximate drainage areas each will service. Indicate the materials, construction and capacity of each structure. Include limits of landscaping and seeded areas. Provide building grade sections(at least one view per axis of building(s) and extended through grading limits). General site grading and drainage shall be indicated by contour lines with an interval of not more than approximately 0.5 m [1.5 feet].

13.1.2.3 Road Alignment Plans: Scale shall be no greater than as indicated in SECTION 01010: STATEMENT OF WORK and profiles showing pavement and shoulder widths, azimuths and curve data, limits of grading, and erosion control. The materials to be used shall be indicated.

13.1.2.4 Traffic Control Plan: Traffic routing and signage shall be in accordance with The Manual on Uniform Traffic Control Devices for Streets and Highways, U.S. Department of Transportation, Federal Highways Administration.

13.1.2.5 Sanitary Sewer and Water Plan: Scale shall be as indicated in SECTION 01010: STATEMENT OF WORK and profiles showing location and elevation of pipe, thrust blocks, manholes, valves connections, etc. Materials and construction of pipes, valves, valve boxes, sewage treatment systems and appurtenances shall be indicated. Specifications shall be provided.

13.1.2.6 Electrical Plan Requirements:

13.1.2.6.1 Required diagrams and details on Site Electrical and Telecommunications Drawings.

13.1.2.6.1.a. Off-Site Electrical and Telecommunications Distribution Plans:
13.1.2.6.1.b. Off-Site Primary Circuit Routing Plans:
13.1.2.6.1.c. Off-Site One Line Diagrams
13.1.2.6.1.d. Off-Site Details.
13.1.2.6.1.e. On-Site Electrical and Telecommunications Distribution Plans:
13.1.2.6.1.f. On-Site One Line Diagrams
13.1.2.6.1.g. On-Site Distribution Transformer Schedule: Provide with the following headings:
Transformer Designation. Transformer Size (KVA). Building(s) Served.
Primary Phase(s) and Circuit to which connected.
13.1.2.6.1.h. On-Site Details (Site Lighting, Trenching, Duct Sections, Manholes, Pad-Mounted Transformers and Switches, etc.).

13.1.2.6.2 See Chapter 9, Electrical Systems, for other design requirements.

13.1.2.7 Specifications: Provide pre-final draft marked-up specifications, which include all sections, which apply to site/utility work.

13.1.2.8 Design Analysis: Design analysis shall include design calculations fully developed to support the design of the site and utility systems included in this submittal.

13.1.2.9 Geotechnical: Soils analysis and geotechnical report. Geotechnical information must be provided to support all assumptions and design parameters utilized in the presented site/utility design as applicable.

13.2 <u>The Final 100% site/utility submittal</u> shall contain as a minimum, the following:

13.2.1 General: A complete set of construction documents plans and specifications at the same level of detail as if the project were to be bid including a complete list of equipment, fixtures and materials to be used. The final (100%) drawings are an extension of the reviewed 90% drawings and are to include the 90% comments and responses. All details shall be shown on the drawings.

13.2.2 The design analysis is an extension o the reviewed 90% design analysis and supports and verifies the design complies with the requirements of the project.

13.2.3 The Final (100%) drawings are an extension of the review 90% drawings and include all revisions incorporated from the 90% review comments.

13.2.3. Provide Final (100%) specifications. The Contractor shall make final identification of all materials at this stage.

13.3 <u>The 90% pre-final building and landscaping design submittal</u> shall contain as a minimum, the following:

13.3.1 Landscaping and Irrigation System: The design submittal shall include drawings clearly showing the piping layout and location of sprinkler heads coordinated with the landscaping plan,

control valves, backflow preventers, rain check switches, controllers, etc. Indicate buildings, walks, shrubbery, trees, and other obstacles that might interfere with the proper operation of the sprinkler system. A design analysis calculating the pressures at each sprinkler head for the capacity and radius of throw is required. Details of the sprinkler head installation, valve boxes, and other irrigation appurtenances shall be submitted.

13.3.2 Landscape, Planting and Turfing

13.3.2.1 The landscape planting design narrative shall describe the analysis of existing site conditions, including an indication of existing plant materials that are to remain on the site. The statement of concept shall indicate specific site problems related to proposed development and the rationale for proposed plant locations. The narrative shall also include a list of suggested types and sizes of plant materials, which are to be used, based upon the designated functional and visual criteria.

13.3.2.2 The drawings shall be prepared at a scale which corresponds with the site layout and grading plans and, likewise, shall include reference coordinates, north arrows, graphic scales and appropriate legends. An overall planting layout shall be developed and shall include enlarged detail plans of specific areas, as needed, to clarify requirements. The proposed layout shall indicate shade trees, evergreen trees, flowering trees, shrub masses, etc., according to designated functional and visual locations of planting. A legend that also indicates sizes of plants recommended for each of the above categories shall be included. The drawings and all subsequent plans shall indicate existing and proposed buildings, paved areas, signs, light standards, transformers, dumpster areas, storm drainage system, and other structures and utilities.

13.3.3 Architectural

13.3.3.1 The architectural analysis, drawings and specifications shall include the 50% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 50% submittal based on comments on the 50% submittal. Architectural specifications must be complete with all edits incorporated in the specification text.

13.3.3.2 Details: Complete Construction details, sections, interior elevations, exterior elevations, etc., shall be provided to describe the methods and materials of design.

13.3.3.3 Pre-wired workstation composite floor plans. Pre-wired workstation typicals - elevations and component inventory. Pre-wired workstation panel identification plan with electrical outlet placement including base feed.

13.3.3.4 Comprehensive Interior Design package shall include the 50% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 50% submittal.

13.3.4 Structural Systems

13.3.4.1 State the live loads to be used for design. Include roof and floor loads; wind loads, lateral earth pressure loads, seismic loads, etc., as applicable.

13.3.4.2 Describe the method of providing lateral stability for the structural system to meet seismic and wind load requirements. Include sufficient calculations to verify the adequacy of the method.

13.3.4.3 Furnish calculations for all principal roof, floor, and foundation members.

13.3.4.4 This submittal shall include drawings showing roof and floor framing plans as applicable. Principal members will be shown on the plans. A foundation plan shall also be furnished showing main footings and grade beams where applicable. Where beam, column, and footing schedules are

used, show schedules and fill in sufficient items to indicate method to be used. Show typical bar bending diagram if applicable. Typical sections shall be furnished for roof, floor, and foundation conditions. Structural drawings for proposals and submittals shall be separate from architectural drawings.

13.3.4.5 Provide any computer analyses used shall be widely accepted, commercially available programs and complete documentation of the input and output of the program.

13.3.4.6 Provide complete seismic analyses for all building structural components. Seismic calculations shall clearly demonstrate compliance with all requirements set forth in the Statement of Work.

13.3.5 Specific Mechanical and Plumbing Requirements:

13.3.5.1 The mechanical and plumbing analysis, drawings and specifications shall include the 50% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 50% submittal based on comments on the 50% submittal. Mechanical and plumbing specifications must be complete with all edits incorporated in the specification text.

13.3.5.2 Details: Construction details, sections, elevations, etc., shall be provided where required for clarification of methods and materials of design. All roof and exterior wall penetrations shall be detailed on the drawings.

13.3.6 Fire Protection: The Fire protection analysis, drawings and specifications shall include 50% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 50% submittal based on comments on the 50% submittal. Fire protection specifications must be complete with all edits incorporated in the specification text.

13.3.7 Electrical and Electronic Systems Requirements

13.3.7.1 The Electrical and Electronic systems design analysis, drawings, and specifications shall include the 50% submittal with corrections incorporated, including the annotated comments indicating what corrections were done on the 50% submittal based on comments on the 50% submittal. All requirements specified in the 50% submittal must be developed and completed to this 90% stage.

13.3.7.2 Electrical and Electronics Floor Plans. The floor plans shall show all principle architectural features of the building, which will affect the electrical design. The floor plans shall also show (but not limited to) the following:

Room designations.
Electrical legend and applicable notes.
Lighting fixtures, properly identified.
Location of smoke detectors and fire alarm devices
Location of telecommunication and cable TV outlets.
Location of all electronic systems devices
Switches for control of lighting.
Receptacles.
Location and designation of panel boards. Plans should clearly indicate type of mounting required (flush or surface) and be reflected accordingly in specifications. Service entrance (conduit and main disconnect).
Location, designation and rating of motors and/or equipment which requires electrical service. Show method of termination and/or connection to motors and/or equipment. Show necessary junction boxes, disconnects, controllers (approximate only), conduit stubs, and receptacles required to serve the motor and/or equipment.
All circuit wiring and cables (number and sizes)
All conduit runs and sizes

All riser and one line diagrams
All other electrical and electronic equipment

13.3.7.3. Building Riser Diagram (from pad-mounted transformer to unit load center panel board): Indicate the types and sizes of electrical equipment and wiring. Include grounding and metering requirements.

13.3.7.4. Load Center and Panelboard Schedule(s): Schedule shall indicate the following information:

Load Center/Panelboard Characteristics (Panel Designation, Voltage, Phase, Wires, Main Breaker Rating and Mounting)
Branch Circuit Designations.
Load Designations.
Circuit Breaker Characteristics. (Number of Poles, Trip Rating, AIC Rating)
Branch Circuit Connected Loads (AMPS).
Special Features.

13.3.7.5 Lighting Fixture Schedule: (Schedule shall indicate the following information:)

Fixture Designation.
General Fixture Description.
Number and Type of Lamp(s).
Type of Mounting.
Voltage
Special Features.

13.3.7.6. Details: Details of all light fixtures shall be provided. Construction details, sections, elevations, etc., shall be provided where required for clarification of methods and materials of design.

13.3.7.7 Electrical and Electronic systems specifications must be complete with all mark-ups and edits incorporated in the specification text.

13.3.7.8 Design analysis and calculations for the electrical systems shall be prepared by a licensed professional engineer with experience and shall be stamped as such. The design analysis shall be separately bound, in one or more volumes. The design analysis shall include all calculations required to support design decisions, including (but not limited to) lighting calculations, voltage drop calculations, load calculations (for transformers, conductor sizes, circuit breaker sizes, panelboard sizes, etc.), and short circuit calculations. The analysis shall also include specific criteria furnished, conference minutes, and cost analyses of all systems considered. Show functional and engineering criteria, design information, and calculations applicable to the project. The analysis shall be organized in a format appropriate for review, approval, and record purposes. The design calculations shall indicate methods and references identified, and shall explain assumptions and conclusions.

13.3.7.9. Voltage Drop (VD) Calculations: Select conductor sizes of primary feeders, site lighting circuits, service laterals, and unit feeder conductors. Calculate maximum length for each phase of each primary circuit, using a maximum allowable VD for each circuit. Calculate voltage drops for each conductor. Maximum allowable voltage drop for site lighting and service laterals is 3%. The combined voltage drop for the service laterals, unit feeders, and branch circuit cannot exceed 5%.

13.3.7.10 See Chapter 9, Electrical Systems, for other design requirements.

13.3.8 Kitchen Requirements: List all references used in the design including Government design documents and industry standards. Provide justification and brief description of the types of equipment, fixtures and piping materials proposed for use. Descriptions shall include narrative and catalog cuts. Prepare detail calculations for systems such as sizing of makeup air systems, exhaust

systems, refrigeration equipment, kitchen equipment and gas piping. List of the materials and equipment proposed shall include the manufacturer's published cataloged product installation specifications and roughing-in data. The data shall include the manufacturer's wiring diagrams, installation specifications, certifications, and the standard warranty for the equipment. Include drawings of all areas. Drawings shall include plans, sections, piping isometric diagrams, control diagrams, sequence of operation, schedules and details. Minimum of 1:50 scale shall be used on all plan drawings, and building sections. The kitchen work for the project shall be constructed in accordance with Unified Facilities Guide Specifications (UFGS). Edited UFGS specification sections shall clearly indicate design intent including products and execution to be provided.

13.3.9 Specifications: Draft of specifications, including index and trade sections.

13.3.10 Sustainable Design: Provide a completed SPiRiT checklist to show compliance with the level indicated in the SOW and incorporated comments on the previous design submittal.

13.4 <u>The Final 100% building and landscaping design submittal</u> shall contain, as a minimum, the following items for all submittals:

13.4.1 General: A complete set of construction documents plans and specifications at the same level of detail as if the project were to be bid including a complete list of equipment, fixtures and materials to be used. The final drawings are an extension of the reviewed 90% drawings and are to include the 90% comments and responses. All details shall be shown on the drawings.

13.4.2 The design analysis is an extension of the reviewed 90% design analysis and supports and verifies that the design complies with the requirements of the project.

13.4.3 Submit final specifications. The specifications shall be coordinated with the drawings and describe in detail all items shown on the drawings.

13.4.4 Landscape and Planting Final design drawing(s) shall include a complete schedule of plant materials which indicates their botanical and common names, plan symbols, quantities, sizes, condition furnished, and pertinent remarks. The drawings shall be prepared at a scale that corresponds with the site layout and grading plans and, likewise, shall include reference coordinates, north arrows, graphic scales and appropriate legends. An overall planting layout shall be developed and shall include enlarged detail plans of specific areas as needed, to clarify requirements. Final design drawings, indicating proposed plants by a (+) mark for the plant location and a circle which is scaled at approximately 2/3 the ultimate growth spread (diameter) of plants, shall also include a complete schedule of plant materials which indicates botanical and common names, plan symbols, quantities, sizes, condition furnished, and pertinent remarks. Final drawings shall also include the basic details for installation of tree, shrub, and ground cover planting, as well as any other applicable details for clarification of specific project requirements.

13.4.5 Architectural

13.4.5.1 The architectural analysis, drawings and specifications shall include the 90% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 50% submittal based on comments on the 90% submittal. Architectural specifications must be complete with all edits incorporated in the specification text.

13.4.5.2 All architectural drawings shall be coordinated with the other engineering disciplines. Ensure that the plans are in compliance with the applicable codes. It will be the Contractor's responsibility to implement the comments generated from any design review submittal as well as verify the consistency between plans and specification. The evaluation of the Contractor's submittals shall be based on degree to which the submittal meet the requirements set forth in this document and the specifications.

13.4.5.4 Comprehensive Interior Design package shall include the 90% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 90% submittal.

13.4.6 Structural Design

13.4.6.1 Furnish complete checked calculations for all structural members. Incorporate any changes required by comments on 90% Design Submittal.

13.4.6.2 Prior to this submittal, structural drawings shall be coordinated with all other design disciplines.

13.4.6.3 The final structural drawings shall contain the following information as a set of general notes:

The allowable soil bearing value.
The design stresses of structural materials used.
The design live loads used in the design of various portions of the structures.
The design wind speed.
The seismic acceleration coefficients, seismic use group, and performance level criteria used in design.

13.4.6.4 All structural drawings and calculations shall be checked and stamped by the designer of record (a registered Professional Engineer).

13.4.7 Specific Mechanical and Plumbing Requirements:

13.4.7.1 The mechanical and plumbing analysis, drawings and specifications shall include the 90% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 90% submittal based on comments on the 90% submittal. Mechanical and plumbing specifications must be complete with all editions incorporated in the specification text.

13.4.7.2 In addition to items submitted in the paragraph 11.4.7.1, the drawings shall be revised to include:

Double line ductwork
Double line piping for all piping 100 mm (4 in.) or larger on 1:50 drawings
Double line piping for all piping 200 mm (8 in.) or larger on 1:100 drawings
Thermostat locations
Size of all ductwork
Size of all piping
All details

13.4.7.3 Details: Construction details, sections, elevations, etc., shall be provided where required for clarification of methods and materials of design. All roof and exterior wall penetrations shall be detailed on the drawings.

13.4.8. Fire Protection: The Fire protection analysis, drawings and specifications shall include 90% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 90% submittal based on comments on the 90% submittal. Fire protection specifications must be complete with all editions incorporated in the specification text.

13.4.9 Specific Electrical and Electronic Requirements:

13.4.9.1 The Electrical and Electronic systems design analysis, drawings, and specifications shall include the 90% submittal with corrections incorporated, including the annotated comments indicating

what corrections were done on the 90% submittal based on comments on the 90% submittal. All requirements specified in the 90% submittal must be developed and completed to this 100% stage.

13.4.10 Kitchen Requirements: The kitchen design analysis, drawings and specifications shall include the 90% submittal with corrections incorporated including the annotated comments indicating what corrections were done on the 90% submittal based on comments on the 90% submittal. Mechanical and plumbing specifications must be complete with all editions incorporated in the specification text.

13.4.11 Specifications: Provide final specifications. The Contractor shall make final identification of all materials and finishes at this stage.

13.4.11 Sustainable Design: Provide a revised completed SPiRiT checklist to show compliance with the bronze level of the SpiRiT checklist due to changes in the design from the 90% submittal to the 100% submittal.

13.5 <u>Design complete submittal:</u>

13.5.1 Design Drawings: Drawings shall be 100% complete, signed and sealed by the designer of record. All previous review comments shall be incorporated.

13.5.2 Design Analysis: Complete design analysis for all design disciplines. The final Fire Protection and Life Safety Analysis shall be included in the Design Analysis.

13.5.3 Comment Response Package: Complete package showing all comments from all previous reviews and the respective response and disposition.

13.5.4 This submittal shall include all drawings and design information from the 100% site/utility submittal to form a complete design package.

13.5.3 Additional Requirements.

a. Compliance Certification

(1) The Contractor shall certify that the features and standards offered in its submittals meet or exceed the corresponding mandatory features and standards stated in the Scope of Work. A certification to this effect shall be included on the title sheet of each submittal made under this section. The certification shall be signed by the person(s) authorized to bind the offeror under the offer, or by persons who have been delegated, in writing such authorization.

(2) The parties understand that, at the time of award, all features and standards proposed in the Contractor's accepted offer, including the mandatory requirements of the RFP, as amended by the Contractor's accepted offer, become binding upon both the Government and the Contractor. Deviations from the features and standards of the accepted offer, including deviations from the RFP's mandatory requirements, as amended by the accepted offer, may be approved by the Contracting Officer upon written application by the Contractor and agreement as to good and sufficient consideration by the parties, reflected in an equitable adjustment to the contract price.

b. Field Inspection. The Contractor shall verify field conditions, which are significant to design, by field inspection, researching and obtaining all necessary as-built drawings and reproducing them for his own use as necessary, and discussing status with knowledgeable personnel. The information shall be reflected in the design documents.

c. Additional Topographic Information. The Government has supplied all or a majority of the topographic information required for the project as part of the topographic survey sheets provided in the Request for Proposals drawings. Any additional topographic information required by the Contractor for design after award of the contract shall be procured and paid for by the successful Proposer.

d. Soil and Foundation Report. A final and complete soil and foundation report shall be furnished by the Contractor in accordance with Site Engineering Section of the Statement of Work.

## 14.0 DESIGN RELATED PRODUCTS

14.1 Architectural Renderings: Contractor shall provide the original and three copies of each ground level perspective artist's renderings of completed typical facilities with walks, parking, and landscaping. Renderings shall be no smaller than 14" x 18" or larger than 28" x 36", multi-colored, and shall be suitably titled, matted, and framed.

14.2 DD Form 1354: Three (3) sets of DD Form 1354, Transfer and Acceptance of Military Real Property shall be prepared in accordance with ER 415-345-38 and submitted to the Contracting Officer.

14.3 Reproduction: Upon Government approval of 100% design documents, the original will be returned to the Contractor for reproduction purposes. The Contractor will be responsible for his own reproduction as well as reproduction for Government use. The Government will require twice the number of copies of the plans and specifications as were required for the review stages, no color boards will be required. The originals will be retained by the Contractor for recording of as-built conditions. Upon completion of the project, the original design documents corrected to reflect as-built conditions will be supplied to the Government.

SECTION TABLE OF CONTENTS

DIVISION 01 - GENERAL REQUIREMENTS

SECTION 01312

QUALITY CONTROL SYSTEM (QCS)

PART 1 GENERAL

1.1 GENERAL
1.1.1 Applicability
1.1.2 Correspondence and Electronic Communications
1.1.3 Other Factors
1.2 QCS SOFTWARE
1.3 SYSTEM REQUIREMENTS
1.4 RELATED INFORMATION
1.4.1 QCS User Guide
1.4.2 Contractor Quality Control (CQC) Training
1.5 CONTRACT DATABASE
1.6 DATABASE MAINTENANCE
1.6.1 Administration
1.6.1.1 Contractor Information
1.6.1.2 Subcontractor Information
1.6.1.3 Correspondence
1.6.1.4 Equipment
1.6.1.5 Management Reporting
1.6.2 Finances
1.6.2.1 Pay Activity Data
1.6.2.2 Payment Requests
1.6.3 Quality Control (QC)
1.6.3.1 Daily Contractor Quality Control (CQC) Reports
1.6.3.2 Deficiency Tracking
1.6.3.3 Three-Phase Control Meetings
1.6.3.4 Accident/Safety Tracking
1.6.3.5 Features of Work
1.6.3.6 QC Requirements
1.6.4 Submittal Management
1.6.5 Schedule
1.6.6 Import/Export of Data
1.7 IMPLEMENTATION
1.8 DATA SUBMISSION VIA COMPUTER DISKETTE OR CD-ROM

SECTION 01312

QUALITY CONTROL SYSTEM (QCS)

## PART 1 GENERAL

### 1.1 GENERAL

The Government will use the Resident Management System for Windows (RMS) to assist in its monitoring and administration of this contract. The Contractor shall use the Government-furnished Construction Contractor Module of RMS, referred to as QCS, to record, maintain, and submit various information throughout the contract period. This joint Government-Contractor use of RMS and QCS will facilitate electronic exchange of information and overall management of the contract. QCS provides the means for the Contractor to input, track, and electronically share information with the Government in t
he following areas:

Administration
Finances
Quality Control
Submittal Monitoring
Scheduling
Import/Export of Data

#### 1.1.1 Applicability

QCS shall be used during both the design and construction phases of the contract.

#### 1.1.2 Correspondence and Electronic Communications

For ease and speed of communications, both Government and Contractor will, to the maximum extent feasible, exchange correspondence and other documents in electronic format. Correspondence, pay requests and other documents comprising the official contract record shall also be provided in paper format, with signatures and dates where necessary. Paper documents will govern, in the event of discrepancy with the electronic version.

#### 1.1.3 Other Factors

Particular attention is directed to Contract Clause, "Schedules for Construction Contracts", Contract Clause, "Payments", Section 01320, PROJECT SCHEDULE, Section 01330, SUBMITTAL PROCEDURES, and Section 01451, CONTRACTOR QUALITY CONTROL, which have a direct relationship to the reporting to be accomplished through QCS. Also, there is no separate payment for establishing and maintaining the QCS database; all costs associated therewith shall be included in the pricing for the work.

## 1.2 QCS SOFTWARE

QCS is a Windows-based program that can be run on a stand-alone personal computer or on a network. The Government will make available the QCS software to the Contractor after award of the contract. Prior to the Pre-Design Conference, the Contractor shall be responsible to download, install and use the latest version of the QCS software from the Government's RMS Internet Website:

(http://winrms.usace.army.mil/contractor's.htm).

Upon specific justification and request by the Contractor, the Government can provide QCS on 3-1/2 inch high-density diskettes or CD-ROM. Any program updates of QCS will be made available to the Contractor via the Government RMS Website as they become available.

## 1.3 SYSTEM REQUIREMENTS

The following listed hardware and software is the minimum system configuration that the Contractor shall have to run QCS:

a. HARDWARE

(1) IBM-compatible PC with 200 MHz Pentium or higher processor 32+ MB RAM

(2) 4 GB hard drive disk space for sole use by the QCS system

(3) 3 1/2 inch high-density floppy drive

(4) Compact disk (CD) Reader

(5) Color monitor

(6) Laser printer compatible with HP LaserJet III or better, with minimum 4 MB installed memory.

(7) Connection to the Internet, minimum 28 BPS

b. SOFTWARE

(1) MS Windows 95 or newer version operating system (MS Windows NT 4.0 or newer is recommended)

(2) Word Processing software compatible with MS Word 97 or newer

(3) Internet browser

(4) The Contractor's computer system shall be protected by virus protection software that is regularly upgraded with all issued manufacturer's updates throughout the life of the contract.

(5) Electronic mail (E-mail) compatible with MS Outlook

## 1.4 RELATED INFORMATION

### 1.4.1 QCS User Guide

After contract award, the Contractor shall download instructions for the installation and use of QCS from the Government RMS Internet Website. In case of justifiable difficulties, the Government will provide the Contractor with a CD-ROM containing these instructions.

### 1.4.2 Contractor Quality Control (CQC) Training

The use of QCS will be discussed with the Contractor's QC System Manager in the course entitled, "Construction Quality Management For Contractors" (Section 01451).

## 1.5 CONTRACT DATABASE

Prior to the pre-design conference, the Government will provide the Contractor with basic contract award data to use for QCS. The Government will provide data updates to the Contractor as needed, generally by files attached to E-mail. These updates will generally consist of submittal reviews, correspondence status, QA comments, and other administrative and QA data.

## 1.6 DATABASE MAINTENANCE

The Contractor shall establish, maintain, and update data for the contract in the QCS database throughout the duration of the contract. The Contractor shall establish and maintain the QCS database at the Contractor's site office. Data updates to the Government shall be submitted by E-mail with file attachments, e.g., daily reports, schedule updates, payment requests. If permitted by the Contracting Officer, a data diskette or CD-ROM may be used instead of E-mail (see Paragraph DATA SUBMISSION VIA COMPUTER DISKETTE OR CD-ROM). The QCS database typically shall include current data on the following items:

### 1.6.1 Administration

#### 1.6.1.1 Contractor Information

The database shall contain the Contractor's name, address, telephone numbers, management staff, and other required items. Within 14 calendar days of receipt of QCS software from the Government, the Contractor shall deliver Contractor administrative data in electronic format via E-mail.

#### 1.6.1.2 Subcontractor Information

The database shall contain the name, trade, address, phone numbers, and other required information for all subcontractors. A subcontractor must be listed separately for each trade to be performed. Each subcontractor/trade shall be assigned a unique Responsibility Code, provided in QCS. Within 14 calendar days of receipt of QCS software from the Government, the Contractor shall deliver subcontractor administrative data in electronic

format via E-mail.

1.6.1.3 Correspondence

All Contractor correspondence to the Government shall be identified with a serial number. Correspondence initiated by the Contractor's site office shall be prefixed with "S". Letters initiated by the Contractor's home (main) office shall be prefixed with "H". Letters shall be numbered starting from 0001. (e.g., H-0001 or S-0001). The Government's letters to the Contractor will be prefixed with "C".

1.6.1.4 Equipment

The Contractor's QCS database shall contain a current list of equipment planned for use or being used on the jobsite, including the most recent and planned equipment inspection dates.

1.6.1.5 Management Reporting

QCS includes a number of reports that Contractor management can use to track the status of the project. The value of these reports is reflective of the quality of the data input, and is maintained in the various sections of QCS. Among these reports are: Progress Payment Request worksheet, QA/QC comments, Submittal Register Status, Three-Phase Inspection checklists.

1.6.2 Finances

1.6.2.1 Pay Activity Data

The QCS database shall include a list of pay activities that the Contractor shall develop in conjunction with the construction schedule. The sum of all pay activities shall be equal to the total contract amount, including modifications. Pay activities shall be grouped by Contract Line Item Number (CLIN), and the sum of the activities shall equal the amount of each CLIN. The total of all CLINs equals the Contract Amount.

1.6.2.2 Payment Requests

All progress payment requests shall be prepared using QCS. The Contractor shall complete the payment request worksheet and include it with the payment request. The work completed, measured as percent or as specific quantities, shall be updated at least monthly. After the update, the Contractor shall generate a payment request report using QCS. The Contractor shall submit the payment requests with supporting data by E-mail with file attachment(s). If permitted by the Contracting Officer, a data diskette may be used instead of E-mail. A signed paper copy of the approved payment request is also required, which shall govern in the event of discrepancy with the electronic version.

1.6.3 Quality Control (QC)

QCS provides a means to track implementation of the 3-phase QC Control System, prepare daily reports, identify and track deficiencies, document

progress of work, and support other contractor QC requirements. The Contractor shall maintain this data on a daily basis. Entered data will automatically output to the QCS generated daily report. The Contractor shall provide the Government a quality control plan within the time required in Section 01451, CONTRACTOR QUALITY CONTROL. Within seven calendar days of Government acceptance, the Contractor shall submit a data diskette or CD-ROM reflecting the information contained in the accepted quality control plan: schedule, pay activities, features of work, submittal register, QC requirements, and equipment list.

1.6.3.1 Daily Contractor Quality Control (CQC) Reports

QCS includes the means to produce the Daily CQC Report. The Contractor may use other formats to record basic QC data. However, the Daily CQC Report generated by QCS shall be the Contractor's official report. Data from any supplemental reports by the Contractor shall be summarized and consolidated onto the QCS-generated Daily CQC Report. Daily CQC Reports shall be submitted as required by Section 01451, CONTRACTOR QUALITY CONTROL. Reports shall be submitted electronically to the Government using E-mail or diskette within 24 hours after the date covered by the report. Use of either mode of submittal shall be coordinated with the Government representative. The Contractor shall also provide the Government a signed, printed copy of the daily CQC report.

1.6.3.2 Deficiency Tracking

The Contractor shall use QCS to track deficiencies. Deficiencies identified by the Contractor will be numerically tracked using QC punch list items. The Contractor shall maintain a current log of its QC punch list items in the QCS database. The Government will log the deficiencies it has identified using its QA punch list items. The Government's QA punch list items will be included in its export file to the Contractor. The Contractor shall regularly update the correction status of both QC and QA punch list items.

1.6.3.3 Three-Phase Control Meetings

The Contractor shall maintain scheduled and actual dates and times of preparatory and initial control meetings in QCS.

1.6.3.4 Accident/Safety Tracking

The Government will issue safety comments, directions, or guidance whenever safety deficiencies are observed. The Government's safety comments will be included in its export file to the Contractor. The Contractor shall regularly update the correction status of the safety comments. In addition, the Contractor shall utilize QCS to advise the Government of any accidents occurring on the jobsite. This brief supplemental entry is not to be considered as a substitute for completion of mandatory reports, e.g., ENG Form 3394 and OSHA Form 200.

1.6.3.5 Features of Work

The Contractor shall include a complete list of the features of work in the

QCS database. A feature of work may be associated with multiple pay activities. However, each pay activity (see subparagraph "Pay Activity Data" of paragraph "Finances") will only be linked to a single feature of work.

#### 1.6.3.6 QC Requirements

The Contractor shall develop and maintain a complete list of QC testing, transferred and installed property, and user training requirements in QCS. The Contractor shall update all data on these QC requirements as work progresses, and shall promptly provide this information to the Government via QCS.

### 1.6.4 Submittal Management

The Contractor shall develop the initial submittal register, ENG Form 4288, SUBMITTAL REGISTER, from the submittal list provided by its Designer of Record. Thereafter, the Contractor shall maintain a complete list of all submittals, including completion of all data columns. Dates on which submittals are received and returned by the Government will be included in its export file to the Contractor. The Contractor shall use QCS to track and transmit all submittals. ENG Form 4025, submittal transmittal form, and the submittal register update, ENG Form 4288, shall be produced using QCS. QCS and RMS will be used to update, store and exchange submittal registers and transmittals, but will not be used for storage of actual submittals.

### 1.6.5 Schedule

The Contractor shall develop a construction schedule consisting of pay activities, in accordance with Section 01320, PROJECT SCHEDULE. This schedule shall be input and maintained in the QCS database either manually or by using the Standard Data Exchange Format (SDEF) (see Section 01320 PROJECT SCHEDULE). The updated schedule data shall be included with each pay request submitted by the Contractor.

### 1.6.6 Import/Export of Data

QCS includes the ability to export Contractor data to the Government and to import submittal register and other Government-provided data, and schedule data using SDEF.

## 1.7 IMPLEMENTATION

Contractor use of QCS as described in the preceding paragraphs is mandatory. The Contractor shall ensure that sufficient resources are available to maintain its QCS database, and to provide the Government with regular database updates. QCS shall be an integral part of the Contractor's management of quality control.

## 1.8 DATA SUBMISSION VIA COMPUTER DISKETTE OR CD-ROM

The Government-preferred method for Contractor's submission of updates, payment requests, correspondence and other data is by E-mail with file

attachment(s). For locations where this is not feasible, the Contracting Officer may permit use of computer diskettes or CD-ROM for data transfer. Data on the disks or CDs shall be exported using the QCS built-in export function. If used, diskettes and CD-ROMs will be submitted in accordance with the following:

### 1.8.1 File Medium

The Contractor shall submit required data on 3-1/2 inch double-sided high-density diskettes formatted to hold 1.44 MB of data, capable of running under Microsoft Windows 95 or newer. Alternatively, CD-ROMs may be used. They shall conform to industry standards used in the United States. All data shall be provided in English.

### 1.8.2 Disk or CD-ROM Labels

The Contractor shall affix a permanent exterior label to each diskette and/or CD-ROM submitted. The label shall indicate in English, the QCS file name, full contract number, contract name, project location, data date, name and telephone number of person responsible for the data.

### 1.8.3 File Names

The Government will provide the file names to be used by the Contractor with the QCS software.

## 1.9 MONTHLY COORDINATION MEETING

The Contractor shall update the QCS database each workday. At least monthly, the Contractor shall generate and submit an export file to the Government with schedule update and progress payment request. As required in Contract Clause "Payments", at least one week prior to submittal, the Contractor shall meet with the Government representative to review the planned progress payment data submission for errors and omissions. The Contractor shall make all required corrections prior to Government acceptance of the export file and progress payment request. Payment requests accompanied by incomplete or incorrect data submittals will be returned. The Government will not process progress payments until an acceptable QCS export file is received.

## 1.10 NOTIFICATION OF NONCOMPLIANCE

The Contracting Officer will notify the Contractor of any detected noncompliance with the requirements of this specification. The Contractor shall take immediate corrective action after receipt of such notice. Such notice, when delivered to the Contractor at the work site, shall be deemed sufficient for the purpose of notification.

SECTION 01320

PROJECT SCHEDULE

## PART 1 GENERAL

### 1.1 ELECTRONIC SCHEDULE REQUIREMENT

The Project Schedule to be prepared by the Contractor shall be electronically prepared using software capable of generating a data file in the Standard Data Exchange Format (SDEF). The Project Schedule shall consist of a network analysis system as described below. In preparing this system the scheduling of Construction is the sole responsibility of the contractor. The requirement for the system is included to assure adequate planning in the execution of the work and to assist the Contracting Officer in appraising the reasonableness of the proposed schedule and evaluating progress of the work for the purposes of payment.

### 1.2 SUBMITTALS

Government acceptance is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Preliminary Project Schedule; G.
Initial Project Schedule; G.
Periodic Schedule Updates; G.

Four copies of the schedules showing codes, values, categories, numbers, items, etc., as required.

Periodic schedule updates shall be submitted monthly.

SD-06 Test Reports

Narrative Report.
Schedule Reports.

Four copies of the reports showing numbers, descriptions, dates, float, starts, finishes, durations, sequences, etc., as required.

SD-07 Certificates

Qualifications; G.

Documentation showing qualifications of personnel preparing schedule reports.

## 1.3 QUALIFICATIONS

The Contractor shall designate an authorized representative who shall be responsible for the preparation of all required project schedule reports. This person shall have previously created and reviewed computerized schedules using the software selected by the Contractor. Qualifications of this individual shall be submitted to the Contracting Officer for review with the Preliminary Project Schedule submission.

# PART 2 PRODUCTS (Not Applicable)

# PART 3 EXECUTION

## 3.1 GENERAL

Pursuant to the Contract Clause, SCHEDULE FOR CONSTRUCTION CONTRACTS, a Project Schedule as described below shall be prepared. The Contractor shall be responsible for scheduling of all design, procurement and construction activities. Contractor management personnel shall actively participate in its development. Designers of record, consultants, subcontractors and suppliers working on the project shall also contribute in developing and maintaining an accurate Project Schedule. The accepted Project Schedule shall be used to measure the progress of the work, to aid in evaluating time extensions, and to provide the basis of all progress payments.

## 3.2 BASIS FOR PAYMENT

The schedule shall be the basis for measuring Contractor progress. Lack of an accepted schedule or scheduling personnel shall result in an inability of the Contracting Officer to evaluate Contractor progress for the purposes of payment. Failure of the Contractor to provide all information, as specified below, shall result in the disapproval of the entire Project Schedule submission and the inability of the Contracting Officer to evaluate Contractor progress for payment purposes. In the case where Project Schedule revisions have been directed by the Contracting Officer and those revisions have not been included in the Project Schedule, then the Contracting Officer may hold retainage up to the maximum allowed by contract, each payment period, until revisions to the Project Schedule have been made.

## 3.3 ELECTRONIC PROJECT SCHEDULE

The computer software system utilized by the Contractor to produce the Project Schedule shall be capable of providing all requirements of this specification. Failure of the Contractor to meet the requirements of this specification shall result in the disapproval of the schedule. Manually generated schedules will not be accepted.

The system noted below is capable of generating a file in the Standard Data Exchange Format (SDEF). All electronic data submittals shall be in SDEF. SDEF information is available from the Contracting Officer.

Vendor/System with SDEF support:
Primavera Systems PRIMAVERA PROJECT PLANNER (P3)

### 3.3.1 Use of the Critical Path Method

The Critical Path Method (CPM) of network calculation shall be used to generate the Project Schedule. The Contractor shall provide the Project Schedule in either the Precedence Diagram Method (PDM) or the Arrow Diagram Method (ADM).

### 3.3.2 Level of Detail Required

With the exception of the preliminary schedule submission, the Project Schedule shall include an appropriate level of detail. Failure to develop or update the Project Schedule or provide data to the Contracting Officer at the appropriate level of detail, as specified by the Contracting Officer, shall result in the disapproval of the schedule. The Contracting Officer will use, but is not limited to, the following conditions to determine the appropriate level of detail to be used in the Project Schedule.

#### 3.3.2.1 Activity Durations

Contractor submissions shall follow the direction of the Contracting Officer regarding reasonable activity durations. Reasonable durations are those that allow the progress of activities to be accurately determined between payment periods (usually less than 2 percent of all non-procurement activities' Original Durations shall be greater than 20 days).

#### 3.3.2.2 Design and Permit Activities

The Contractor shall integrate design and permitting activities, including necessary conferences and follow-up actions and design package submission dates into the schedule. The design schedule showing the sequence of events involved in carrying out the design tasks within the specific contract period shall be included in the project schedule. The design schedule should be at a detailed level of scheduling sufficient to identify all major tasks including those that control the flow of work. The design schedule shall include review and correction periods associated with each item. This should be a forward planning as well as a project-monitoring tool. The schedule shall reflect calendar days and not specific dates for each activity. If the design schedule is changed, the Contractor shall submit a revised schedule reflecting the change within seven calendar days of the change.

#### 3.3.2.3 Procurement Activities

Tasks related to the procurement of long lead materials or equipment shall be included as separate activities in the project schedule. Long lead materials and equipment are those materials that have a procurement cycle of over 90 days. Examples of procurement process activities include, but are not limited to: submittals, approvals, procurement, fabrication, delivery, installation, start-up, and testing.

3.3.2.4 Government Activities

Government and other agency activities that could impact progress shall be shown. These activities include, but are not limited to: design reviews, submittal reviews, environmental permit approvals by State regulators, inspections, utility tie-in, Government Furnished Equipment (GFE) and notice to proceed for phasing requirements.

3.3.2.5 Responsibility

All activities shall be identified in the project schedule by the party responsible to perform the work. Responsibility includes, but is not limited to, the subcontracting firm, contractor work force, or government agency performing a given task. The responsible party for each activity shall be identified by the Responsibility Code.

3.3.2.6 Work Areas

All activities shall be identified in the project schedule by the work area in which the activity occurs. Activities shall not be allowed to cover more than one work area. The work area of each activity shall be identified by the Work Area Code.

3.3.2.7 Modification or Claim Number

Any activity that is added or changed by contract modification or used to justify claimed time shall be identified by a mod or claim code that changed the activity. Activities shall not belong to more than one modification or claim item. The modification or claim number of each activity shall be identified by the Mod or Claim Number

3.3.2.8 Bid Item

All activities shall be identified in the project schedule by the Contract Line Item to which the activity belongs. An activity shall not contain work in more than one line item. The line item for each appropriate activity shall be identified by the Bid Item Code.

3.3.2.9 Feature of Work

All activities shall be identified in the project schedule according to the feature of work to which the activity belongs. Feature of work refers, but is not limited to a work breakdown structure for the project. The feature of work for each activity shall be identified by the Feature of Work Code.

3.3.3 Scheduled Project Completion

The schedule interval shall extend from notice-to-proceed to the contract completion date.

3.3.3.1 Project Start Date

The schedule shall start no earlier than the date that the Notice to Proceed (NTP) was acknowledged. The Contractor shall include as the first

activity in the project schedule an activity called "Start Project". The "Start Project" activity shall have: an "ES" constraint, a constraint date equal to the date that the NTP was acknowledged, and a zero day duration.

#### 3.3.3.2 Constraint of Last Activity

Completion of the last activity in the schedule shall be constrained by the contract completion date. Calculation on project updates shall be such that if the early finish of the last activity falls after the contract completion date, then the float calculation shall reflect a negative float on the critical path. The Contractor shall include as the last activity in the project schedule an activity called "End Project". The "End Project" activity shall have: an "LF" constraint, a constraint date equal to the completion date for the project, and a zero day duration.

#### 3.3.3.3 Early Project Completion

In the event the project schedule shows completion of the project prior to the contract completion date, the Contractor shall identify those activities that have been accelerated and/or those activities that are scheduled in parallel to support the Contractor's "early" completion. Contractor shall specifically address each of the activities noted at every project schedule update period to assist the Contracting Officer in evaluating the Contractor's ability to actually complete prior to the contract period.

### 3.3.4 Interim Completion Dates

Contractually specified interim completion dates shall also be constrained to show negative float if the early finish date of the last activity in that phase falls after the interim completion date. The completion dates of each phase of the design-build contract shall be identified as interim completion dates on the Project Schedule.

### 3.3.5 Default Progress Data Disallowed

Actual Start and Finish dates shall not be automatically updated by default mechanisms that may be included in CPM scheduling software systems. Actual Start and Finish dates on the CPM schedule shall match those dates provided from Contractor Quality Control Reports. Failure of the Contractor to document the Actual Start and Finish dates on the Daily Quality Control report for every in-progress or completed activity and ensure that the data contained on the Daily Quality Control reports is the sole basis for schedule updating shall result in the disapproval of the Contractor's schedule and the inability of the Contracting Officer to evaluate Contractor progress for payment purposes.

### 3.3.6 Out-of-Sequence Progress

Activities that have posted progress without predecessors being completed (Out-of-Sequence Progress) will be allowed only on a case-by-case acceptance of the Contracting Officer. The Contracting Officer may direct that changes in schedule logic be made to correct any or all out-of-sequence work.

### 3.3.7 Extended Non-Work Periods

Designation of Holidays to account for non-work periods of over 5 days will not be allowed. Non-work periods of over 5 days shall be identified by addition of activities that represent the delays. Modifications to the logic of the project schedule shall be made to link those activities that may have been impacted by the delays to the newly added delay activities.

### 3.3.8 Negative Lags

Lag durations contained in the project schedule shall not have a negative value.

## 3.4 PROJECT SCHEDULE SUBMISSIONS

The Contractor shall provide the submissions as described below. The data disk, reports, and network diagrams required for each submission are contained in paragraph SUBMISSION REQUIREMENTS.

### 3.4.1 Preliminary Project Schedule Submission

The Preliminary Project Schedule, defining the Contractor's planned operations for the first 90 calendar days shall be submitted for approval within 30 calendar days after Notice to Proceed is acknowledged. The accepted preliminary schedule shall be used for payment purposes not to exceed 90 calendar days after Notice to Proceed.

### 3.4.2 Initial Project Schedule Submission

The Initial Project Schedule shall be submitted for acceptance within 60 calendar days after Notice to Proceed. The schedule shall provide a reasonable sequence of activities, which represent work through the entire project and shall be at a reasonable level of detail.

### 3.4.3 Periodic Schedule Updates

Based on the result of progress meetings, specified in "Periodic Progress Meetings," the Contractor shall submit periodic schedule updates. These submissions shall enable the Contracting Officer or to assess Contractor's progress. If the Contractor fails or refuses to furnish the information and project schedule data, which in the judgement of the Contracting Officer or authorized representative, is necessary for verifying the contractor's progress, the Contractor shall be deemed not to have provided an estimate upon which progress payment may be made.

### 3.4.4 Standard Activity Coding Dictionary

The Contractor shall submit, with the Initial Project Schedule, a coding scheme that shall be used throughout the project for all activity codes contained in the schedule. The coding scheme submitted shall list the values for each activity code category and translate those values into project specific designations. For example, a Responsibility Code Value, "ELE", may be identified as "Electrical Subcontractor." Activity code

values shall represent the same information throughout the duration of the contract. Once accepted with the Initial Project Schedule submission, changes to the activity coding scheme must be accepted by the Contracting Officer.

## 3.5 SUBMISSION REQUIREMENTS

The following items shall be submitted by the Contractor for the initial submission, and every periodic project schedule update throughout the life of the project:

### 3.5.1 Data Disks

Two data disks or two sets of data disks containing the project schedule shall be provided. Data on the disks shall be in the Standard Data Exchange Format (SDEF), in accordance with ER-1-1-11, PROGRESS, SCHEDULES, AND NETWORK ANALYSIS SYSTEMS, Appendix A, Standard Data Exchange Format Specification (attached at the end of this Project Schedule specification.

#### 3.5.1.1 File Medium

Required data shall be submitted on 3.5-inch disks, formatted to hold 1.44 MB of data, under the MS-Windows operating system.

#### 3.5.1.2 Disk Label

A permanent exterior label shall be affixed to each disk submitted. The label shall indicate the type of schedule (Initial, Update, or Change), full contract number, project name, project location, data date, name and telephone number or person responsible for the schedule, and the operating system and version used to format the disk.

#### 3.5.1.3 File Name

Each file submitted shall have a name related to either the schedule data date, project name, or contract number. The Contractor shall develop a naming convention that will ensure that the names of the files submitted are unique. The Contractor shall submit the file naming convention to the Contracting Officer for approval.

### 3.5.2 Narrative Report

A Narrative Report shall be provided with each update of the project schedule. This report shall be provided as the basis of the Contractor's progress payment request. The Narrative Report shall include: a description of activities along the critical path(s), a description of current and anticipated problem areas or delaying factors and their impact, and an explanation of corrective actions taken.

### 3.5.3 Accepted Changes Verification

Only project schedule changes that have been previously accepted by the Contracting Officer shall be included in the schedule submission. The Narrative Report shall specifically reference, on an activity by activity

basis, all changes made since the previous period and relate each change to documented, accepted schedule changes.

3.5.4 Schedule Reports

The format for each activity for the schedule reports listed below shall contain: Activity Numbers, Activity Description, Original Duration, Remaining Duration, Early Start Date, Early Finish Date, Late Start Date, Late Finish Date, Total Float. Actual Start and Actual Finish Dates shall be printed for those activities in progress or completed.

3.5.4.1 Activity Report

A list of all activities sorted according to activity number and then sorted according to Early Start Date. For completed activities the Actual Start Date shall be used as the secondary sort.

3.5.4.2 Logic Report

A list of Preceding and Succeeding activities for every activity in ascending order by activity number and then sorted according to Early Start Date. For completed activities the Actual Start Date shall be used as the secondary sort.

3.5.4.3 Total Float Report

A list of all activities sorted in ascending order of total float. Activities that have the same amount of total float shall be listed in ascending order of Early Start Dates.

3.5.4.4 Earnings Report

A compilation of the Contractor's Total Earnings on the project from the Notice to Proceed until the most recent Monthly Progress Meeting. This report shall reflect the Earnings of specific activities based on the agreements made in the field and approved between the Contractor and Contracting Officer at the most recent Monthly Progress Meeting. Provided that the Contractor has provided a complete schedule update, this report shall serve as the basis of determining Contractor Payment. Activities shall be grouped by bid item and sorted by activity numbers. This report shall: sum all activities in a bid item and provide a bid item percent; and complete and sum all bid items to provide a total project percent complete. The printed report shall contain, for each activity: Activity Number, Activity Description, Original Budgeted Amount, Total Quantity, Quantity to Date, Percent Complete (based on cost), Earnings to Date.

3.5.5 Network Diagram

The network diagram shall be required on the initial schedule submission, on monthly schedule update submissions, or whenever any logic changes have occurred, to include addition or deletion of activities due to modifications to the project. The network diagram shall depict and display the order and interdependence of activities and the sequence in which the work is to be accomplished. The activity or event number, description,

duration, and estimated earned value shall be shown on the diagram. The Contracting Officer will use, but is not limited to, the following conditions to review compliance with this paragraph:

3.5.5.1 Continuous Flow

Diagrams shall show a continuous flow from left to right with no arrows from right to left. The activity or event number, description, duration, and estimated earned value shall be shown on the diagram.

3.5.5.2 Project Milestone Dates

Dates shall be shown on the diagram for start of project, any contract required interim completion dates, and contract completion dates.

3.5.5.3 Critical Path

The critical path shall be clearly shown.

3.5.5.4 Banding

Activities shall be grouped to assist in the understanding of the activity sequence. Typically, this flow will group activities by work area and/or responsibility.

3.5.5.5 S-Curves

A graph of anticipated earnings (S-Curves) showing cumulative for the duration of the project. The vertical scale shall show earnings/percent complete from 0%-100%. The horizontal scale shall be a time scale showing the calendar months of the project. Three curves shall be plotted on the same graph; the earnings/percent complete based on early finish dates; the earnings/percent complete based on late finish dates; the actual earnings/percent complete to date.

3.5.5.6 Bar Chart

A bar chart covering the previous month's activities and progress, and the planned activities over 3 months projected into the future. The chart shall also include actual and anticipated earnings.

3.6 PERIODIC PROGRESS MEETINGS

Progress meetings to discuss payment shall include a monthly onsite meeting or other regular intervals mutually agreed to at the preconstruction conference. During this meeting the Contractor shall describe, on an activity by activity basis, all proposed revisions and adjustments to the project schedule required to reflect the current status of the project. The Contracting Officer will accept activity progress, proposed revisions, and adjustments as appropriate.

3.6.1 Meeting Attendance

The Contractor's Project Manager and Scheduler shall attend the regular

progress meeting.

### 3.6.2 Update Submission Following Progress Meeting

A complete update of the project schedule containing all accepted progress, revisions, and adjustments, based on the regular progress meeting, shall be submitted not later than 4 working days after the monthly progress meeting.

### 3.6.3 Progress Meeting Contents

Update information, including Actual Start Dates, Actual Finish Dates, Remaining Durations, and Cost-to-Date shall be subject to the approval of the Contracting Officer. The following is a minimum set of items that the Contractor shall address, on an activity by activity basis, during each progress meeting.

#### 3.6.3.1 Start and Finish Dates

The Actual Start and Actual Finish dates for each activity currently in-progress or completed activities.

#### 3.6.3.2 Time Completion

The estimated Remaining Duration for each activity in-progress. Time-based progress calculations must be based on Remaining Duration for each activity.

#### 3.6.3.3 Cost Completion

The earnings for each activity started. Payment will be based on earnings for each in-progress or completed activity. Payment for individual activities will not be made for work that contains quality defects. A portion of the overall project amount may be retained based on delays of activities.

#### 3.6.3.4 Logic Changes

All logic changes pertaining to Notice to Proceed on change orders, change orders to be incorporated into the schedule, contractor proposed changes in work sequence, corrections to schedule logic for out-of-sequence progress, lag durations, and other changes that have been made pursuant to contract provisions shall be specifically identified and discussed.

#### 3.6.3.5 Other Changes

Other changes required due to delays in completion of any activity or group of activities include: 1) delays beyond the Contractor's control, such as strikes and unusual weather. 2) delays encountered due to submittals, Government Activities, deliveries or work stoppages which make re-planning the work necessary, and 3) a schedule which does not represent the actual prosecution and progress of the work.

## 3.7 REQUESTS FOR TIME EXTENSIONS

In the event the Contractor requests an extension of the completion date, he shall furnish such justification, project schedule data and supporting evidence as the Contracting Officer may deem necessary for a determination as to whether or not the Contractor is entitled to an extension of time under the provisions of the contract. Submission of proof of delay, based on revised activity logic, duration, and costs (updated to the specific date that the delay occurred) is obligatory to any acceptance.

### 3.7.1 Justification of Delay

The project schedule shall clearly display that the Contractor has used, in full, all the float time available for the work involved with this request. The Contracting Officer's determination as to the number of allowable days of time extension shall be based upon the project schedule updates in effect for the time period in question, and other factual information. Actual delays that are found to be caused by the Contractor's own actions, which result in the extension of the schedule, will not be a cause for a time extension to the project completion date.

### 3.7.2 Submission Requirements

The Contractor shall submit a justification for each request for a change in the project completion date of under 2 weeks based upon the most recent schedule update at the time of the Notice to Proceed or constructive direction issued for the change. Such a request shall be in accordance with the requirements of other appropriate Contract Clauses and shall include, as a minimum:

a. A list of affected activities, with their associated project schedule activity number.

b. A brief explanation of the causes of the change.

c. An analysis of the overall impact of the changes proposed.

d. A sub-network of the affected area.

Activities impacted in each justification for change shall be identified by a unique activity code contained in the required data file.

### 3.7.3 Additional Submission Requirements

For any requested time extension of over 2 weeks, the Contracting Officer may request an interim update with revised activities for a specific change request. The Contractor shall provide this disk within 4 days of the Contracting Officer's request.

## 3.8 DIRECTED CHANGES

If Notice to Proceed (NTP) is issued for changes prior to settlement of price and/or time, the Contractor shall submit proposed schedule revisions to the Contracting Officer within 2 weeks of the NTP being issued. The proposed revisions to the schedule will be accepted by the Contracting Officer prior to inclusion of those changes within the project schedule.

If the Contractor fails to submit the proposed revisions, the Contracting Officer may furnish the Contractor suggested revisions to the project schedule. The Contractor shall include these revisions in the project schedule until revisions are submitted, and final changes and impacts have been negotiated. If the Contractor has any objections to the revisions furnished by the Contracting Officer, the Contractor shall advise the Contracting Officer within 2 weeks of receipt of the revisions. Regardless of the objections, the Contractor shall continue to update the schedule with the Contracting Officer's revisions until a mutual agreement in the revisions is reached. If the Contractor fails to submit alternative revisions within 2 weeks of receipt of the Contracting Officer's proposed revisions, the Contractor will be deemed to have concurred with the Contracting Officer's proposed revisions. The proposed revisions will then be the basis for an equitable adjustment for performance of the work.

## 3.9 OWNERSHIP OF FLOAT

Float available in the schedule, at any time, shall not be considered for the exclusive use of either the Government or the Contractor.

-- End of Section Table of Contents --

SECTION 01330

SUBMITTAL PROCEDURES

PART 1 GENERAL

1.1 SUBMITTAL IDENTIFICATION

Submittals required are identified by SD numbers and titles as follows:

SD-01 Preconstruction Submittals

SD-02 Shop Drawings

SD-03 Product Data

SD-04 Samples

SD-05 Design Data

SD-06 Test Reports

SD-07 Certificates

SD-08 Manufacturer's Instructions

SD-09 Manufacturer's Field Reports

SD-10 Operation and Maintenance Data

SD-11 Closeout Submittals

1.2 SUBMITTAL CLASSIFICATION

Submittals are classified as follows:

1.2.1 Government Approved/Accepted

Governmental approval/acceptance is required for any deviations from the Solicitation or Accepted Proposal and other items as designated by the Contracting Officer. Within the terms of the Contract Clause entitled "Specifications and Drawings for Construction", they are considered to be "shop drawings". The Contractor shall provide the Government with six (6) copies of all Government Approved/Accepted construction submittals.

1.2.2 Information Only

All submittals not requiring Government acceptance/approval will be for information only. They are not considered to be "shop drawings" within the terms of the Contract Clause referred to above. The Contractor shall

provide the Government with four (4) copies of all Information Only submittals.

## 1.3 GOVERNMENT RESPONSIBILITY

### 1.3.1 Extensions of Design

Government review is required for extensions of design construction submittals used to define contract conformity, and for deviation from the completed design. Review will be only for conformance with the contract requirements. Included are only those construction submittals for which the Designer of Record design documents do not include enough detail to ascertain contract compliance. Government review is not required for extensions of design such as structural steel or reinforcement shop drawings.

### 1.3.2 Government Accepted/Approved Submittals

The Contracting Officer's conformance review or approval of submittals shall not be construed as a complete check, but will indicate only that the design, general method of construction, materials, detailing and other information appear to meet the Solicitation and Accepted Proposal. Government review or approval will not relieve the Contractor of the responsibility for any errors that may exist. The Contractor, under the Design and CQC requirements of this contract, is responsible for the design, dimensions, all design extensions, such as the design of adequate connections and details, etc., and the satisfactory construction of all work. After submittals have been reviewed for conformance or accepted/approved, as applicable, by the Contracting Officer, no resubmittal for the purpose of substituting materials or equipment will be considered unless accompanied by an explanation of why a substitution is necessary.

## 1.4 CONTRACTOR RESPONSIBILITY

### 1.4.1 Designer of Record

The Designer of Record shall approve all extensions of design, critical materials, any deviations from the solicitation, the accepted proposal, the completed design, equipment whose compatibility with the entire system must be checked, and other items as designated by the Contracting Officer. Within the terms of the Contract Clause entitled "Specifications and Drawings for Construction", these are considered to be "shop drawings". The Government may review Designer of Record approved submittals for conformance to the Solicitation and Accepted Proposal. The Government will review all submittals designated as deviating from the Solicitation or Accepted Proposal, as described below.

### 1.4.2 Disapproved Submittals

The Contractor shall make all corrections required by the Contracting Officer, obtain the Designer of Record's approval, when applicable, and promptly furnish a corrected submittal in the form and number of copies specified for the initial submittal. Any "information only" submittal

found to contain errors or unapproved deviations from the Solicitation or Accepted Proposal shall be resubmitted as one requiring "approval" action, requiring both Designer of Record and Government acceptance/approval. If the Contractor considers any correction indicated by the Government on the submittals to constitute a change to the contract, it shall promptly provide a notice in accordance with the Contract Clause "Changes" to the Contracting Officer.

## 1.5 WITHHOLDING OF PAYMENT

No payment for materials incorporated in the work will be made if all required Designer of Record or Government acceptances/approvals have not been obtained. No payment will be made for any materials incorporated into the work for any conformance review submittals or information only submittals found to contain errors or deviations from the Solicitation or Accepted Proposal.

## 1.6 SUBMITTALS

Government acceptance/approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. The following shall be submitted in accordance with this section:

SD-01 Preconstruction Submittals

Submittal Register (ENG Form 4288); G.
Monthly Updates (ENG Form 4288)

Four copies of the completed ENG Form 4288.

One copy of the monthly update shall be submitted together with the monthly progress payment request.

# PART 2 PRODUCTS (Not Applicable)

# PART 3 EXECUTION

## 3.1 GENERAL

The Contractor shall make submittals as required by the specifications. The Contracting Officer may request submittals in addition to those specified when deemed necessary to adequately describe the work covered in the respective sections. Units of weights and measures used on all submittals shall be the same as those used in the contract drawings. Each submittal shall be complete and in sufficient detail to allow ready determination of compliance with contract requirements. Prior to submittal, all items shall be checked and approved by the Contractor's Quality Control (CQC) System Manager and each item shall be stamped, signed, and dated by the CQC System Manager indicating action taken. Proposed deviations from the contract requirements shall be clearly identified. Submittals shall include items such as: Contractor's, manufacturer's, or fabricator's drawings; descriptive literature including (but not limited to) catalog cuts, diagrams, operating charts or curves; test reports; test cylinders; samples; O&M manuals (including parts list);

certifications; warranties; and other such required submittals. Submittals requiring Government acceptance/approval shall be scheduled and made prior to the acquisition of the material or equipment covered thereby. Samples remaining upon completion of the work shall be picked up and disposed of in accordance with manufacturer's Material Safety Data Sheets (MSDS) and in compliance with existing laws and regulations.

### 3.1.1 Design Submittals

The Contractor shall provide design submittals in accordance with Section 01012 entitled "DESIGN AFTER AWARD".

## 3.2 SUBMITTAL REGISTER (ENG FORM 4288)

The Designers of Record shall develop a complete list of submittals required during the design and construction phases of the contract. The Contractor shall develop a Submittal Register, ENG Form 4288, from this list, including any other submittals that may be required by other parts of the contract. The Contractor shall use the government-provided software, QCS (see Section 01312), to create the ENG Form 4288. The completed Submittal Register shall be submitted to the Contracting Officer for approval within 15 calendar days after Notice to Proceed with the design phase. The submit dates and need dates in the submittal register shall be coordinated with the dates in the Contractor's progress schedule. Updates to the submittal register showing the Contractor action codes and actual submittal dates with Government action codes and action dates shall be submitted monthly together with the monthly payment request, or until all submittals have been satisfactorily completed. When the progress schedule is revised, the submittal register shall also be revised and both resubmitted for approval. The approved submittal register will serve as a scheduling document for submittals and will be used to control submittal actions throughout the contract period.

## 3.3 SCHEDULING

Submittals covering component items forming a system or items that are interrelated shall be scheduled to be coordinated and submitted concurrently. Certifications to be submitted with the pertinent drawings shall be so scheduled. Adequate time (for design submittals, see Section 01012; for construction submittals, a minimum of 30 calendar days exclusive of mailing time) shall be allowed and shown on the register for review and approval by the Government. No delay damages or time extensions will be allowed for time lost in incorrect, incomplete and/or late submittals. An additional 15 calendar days shall be allowed and shown on the register for review and approval of submittals for food service equipment and refrigeration and HVAC control systems.

## 3.4 TRANSMITTAL FORM (ENG FORM 4025)

A transmittal form (ENG Form 4025) shall be used for submitting both Government approved and information only submittals. The Contractor shall use the government-provided software, QCS (see Section 01312), to create the ENG Form 4025. A separate transmittal form shall be used for each specification section. This form shall be properly completed by filling

out all the heading blank spaces and identifying each item submitted. Special care shall be exercised to ensure proper listing of the specification paragraph and/or sheet number of the contract drawings pertinent to the data submitted for each item.

## 3.5 SUBMITTAL PROCEDURE

Submittals shall be made as follows:

### 3.5.1 Procedures

Submittals to the Contracting Officer are required in the number of copies identified in paragraph 1.2 and shall be submitted as follows:

U.S. Army Corps of Engineer District, Honolulu
Fort Shafter Resident Office
Bldg 230
Fort Shafter, Hawaii 96858-5440

### 3.5.2 Deviations

a. For submittals that include proposed deviations requested by the Contractor, the column "variation" on ENG Form 4025 shall be checked. The Contractor shall set forth in writing the reason for any deviations and annotate such deviations on the submittal. The Contractor's Designer of Record approval is required for any proposed deviations. The Government reserves the right to rescind inadvertent approval of submittals containing unnoted deviations.

b. In cases where "trade names or equal" are used in the plans and/or Technical Specifications, any "equal" substitution by the Contractor is considered a variance and will require the Government's approval. Approval action by the Contracting Officer will not relieve the Contractor of his quality control responsibility and compliance with the contract, except for those specific portions of the submittal which clearly highlight the departures from the contract, and which are brought to the attention of the Government. The Contractor shall be responsible for all corrective actions, when submittals containing provisions of non-compliance with the contract are not specifically brought to the Government's attention. Any associated cost or time loss from such corrective actions shall not be made subject to a claim against the Government.

c. Variations from the contract requirements may require an appropriate contract modification prior to acceptance by the Government; however, such pending action shall not be a basis of claim for time or additional cost against the Government, since the Contractor still has the option to comply with the original contract requirements. If the variation is of a minor nature and does not affect a change in cost or time of performance, a modification may not be issued. All variations shall meet the standards set by the contract documents.

## 3.6 COORDINATION OF LAYOUTS

The Contractor Quality Control (CQC) organization is responsible for insuring that the shop drawings and submittals of the different trades are coordinated in order that space conflicts during installation/construction of mechanical, electrical, architectural, civil, structural and other items of work are avoided. The Contractor shall be required to prepare/develop coordinated working layout drawings prior to commencement of any feature of work, at any contractor tier, unless otherwise directed by the Contracting Officer. These layout drawings shall be reviewed and certified by the CQC organization prior to the start of work in any area. The CQC shall insure that layout drawings indicate all necessary features of work, providing for a coordinated arrangement of the various installations, giving full consideration for access to installed equipment/systems and the future maintenance of these items. Interference between equipment and systems or construction materials which cannot be resolved between Contractor and subcontracting tiers shall be resolved by the Contracting Officer at no additional cost to the Government, if it is determined that adequate space was available and installations could have been accommodated within the designated construction area through properly coordinated layout drawings. One (1) CQC certified copy of all layout drawings shall be available for Government's review five (5) working days prior to scheduled commencement of the work. Submission shall be made upon Government's request.

## 3.7 CONTROL OF SUBMITTALS

The Contractor shall carefully control his procurement operations to ensure that each individual submittal is made on or before the Contractor scheduled submittal date shown on the approved "Submittal Register."

## 3.8 GOVERNMENT ACCEPTED/APPROVED SUBMITTALS

Upon completion of review of submittals requiring Government approval, the submittals will be identified as having received approval by being so stamped and dated. The Contracting Officer will retain four (4) copies of the submittal and two (2) copies of the submittal will be returned to the Contractor. If the Government performs a conformance review of other Designer of Record approved submittals, the submittals will be so identified and returned, as described above.

## 3.9 INFORMATION ONLY SUBMITTALS

Submittals provided For Information Only (FIO) to the Government shall be submitted in four (4) copies, including resubmittals. Normally submittals for information only will not be returned. Approval of the Contracting Officer is not required on information only submittals. The Government reserves the right to require the Contractor to resubmit any item found not to comply with the contract. This does not relieve the Contractor from the obligation to furnish material conforming to the plans and specifications; will not prevent the Contracting Officer from requiring removal and replacement of nonconforming material incorporated in the work; and does not relieve the Contractor of the requirement to furnish samples for testing by the Government laboratory or for check testing by the Government in those instances where the technical specifications so prescribe.

3.10 STAMPS

Stamps used by the Contractor on the submittal data to certify that the submittal meets contract requirements shall be similar to the following:

```
_____________________________________________________________________
|                              CONTRACTOR                             |
|                                                                     |
|                              (Firm Name)                            |
|                                                                     |
|                                                                     |
|                                                                     |
| _____ Approved                                                      |
|                                                                     |
|                                                                     |
| _____ Approved with corrections as noted on submittal data and/or   |
| attached sheets(s).                                                 |
|                                                                     |
|                                                                     |
|                                                                     |
| SIGNATURE:  ____________________________________________________ |
|                                                                     |
| TITLE:  (DESIGNER OF RECORD)                                        |
|                                                                     |
| DATE:  ________________________________________________________ |
|                                                                     |

SECTION 01312

CONTRACTOR QUALITY CONTROL

## PART 1 GENERAL

### 1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

| | |
|---|---|
| ASTM D 3740 | (1996) Minimum Requirements for Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction |
| ASTM E 329 | (1995b) Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction |

### 1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Quality Control Plan; G.

### 1.3 PAYMENT

Separate payment will not be made for providing and maintaining an effective Quality Control system, and all costs associated therewith shall be included in the applicable unit prices or lump-sum prices contained in the Bidding Schedule.

## PART 2 PRODUCTS (Not Applicable)

## PART 3 EXECUTION

### 3.1 GENERAL

The Contractor is responsible for quality control and shall establish and maintain an effective quality control system in compliance with the Contract Clause titled, "Inspection of Construction." The quality control

system shall consist of plans, procedures, and the organization necessary to produce an end product that complies with the contract requirements. The system shall cover all design and construction operations, both onsite and offsite, and shall be keyed to the proposed design and construction sequence.

The Project Manager will be held responsible for the quality of work on the job and is subject to removal by the Contracting Officer for non-compliance with quality requirements specified in the contract. The Project Manager in this context shall mean the individual with the responsibility for the overall management of the project, including design, construction, quality, and production.

## 3.2 QUALITY CONTROL PLAN

### 3.2.1 Contractor Quality Control

The Contractor shall furnish for review by the Government, not later than 30 days after receipt of Notice to Proceed, the Contractor Quality Control (CQC) Plan proposed to implement the requirements of the Contract Clause titled "Inspection of Construction." The plan shall identify personnel, procedures, control, instructions, test, records, and forms to be used. The Government will consider an interim plan for the first 90 days of operation. Design and construction will be permitted to begin only after acceptance of the CQC Plan or acceptance of an interim plan applicable to the particular feature of work to be started. Work outside of the features of work included in an accepted interim plan will not be permitted to begin until acceptance of a CQC Plan or another interim plan containing the additional features of work to be started.

### 3.2.2 Content of the CQC Plan

The CQC Plan shall include, as a minimum, the following to cover all design and construction operations, both onsite and offsite, including work by subcontractors, designers of record, consultants, architect/engineers (A/E), fabricators, suppliers, and purchasing agents:

a. A description of the quality control organization, including a chart showing lines of authority and acknowledgment that the CQC staff shall implement the three phase control system for all aspects of the construction work specified. The staff shall include a CQC System Manager who shall report to the Project Manager or someone higher in the Contractor's organization.

b. The name, qualifications (in resume format), duties, responsibilities, and authorities of each person assigned a CQC function. Technicians responsible for sampling and testing of concrete shall be certified by the American Concrete Institute (ACI) or the Concrete Technicians Association of Hawaii (CTAH). Proof of certification shall be included in the quality control Plan. Personnel qualifications may be furnished incrementally as the work progresses, but in no case, less than fourteen (14) calendar days before personnel are required on the job.

c. A copy of the letter to the CQC System Manager signed by an authorized official of the firm which describes the responsibilities and delegates sufficient authorities to adequately perform the functions of the CQC System Manager, including authority to stop work which is not in compliance with the contract. The CQC System Manager shall issue letters of direction to all other various quality control representatives outlining duties, authorities, and responsibilities. Copies of these letters shall also be furnished to the Government.

d. Procedures for scheduling, reviewing, certifying, and managing submittals, including those of subcontractors, designers of record, consultants, A/E's, offsite fabricators, suppliers, and purchasing agents. These procedures shall be in accordance with Section 01330, SUBMITTAL PROCEDURES, or Section 01012, DESIGN AFTER AWARD, as applicable.

e. Control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test.

f. For all proposed QC materials testing laboratories the contractor must submit a current HED or MTC letter of validation.

g. Procedures for tracking preparatory, initial, and follow-up control phases and control, verification, and acceptance tests including documentation.

h. Procedures for tracking construction deficiencies from identification through acceptable corrective action. These procedures shall establish verification that identified deficiencies have been corrected.

i. Reporting procedures, including proposed reporting formats.

j. A list of the definable features of work. A definable feature of work is a task that is separate and distinct from other tasks, has separate control requirements, and may be identified by different trades or disciplines, or it may be work by the same trade in a different environment. Although each section of the specifications may generally be considered as a definable feature of work, there are frequently more than one definable features under a particular section. This list will be agreed upon during the coordination meeting.

3.2.3 Additional Requirements for the Design Quality Control (DQC) Plan

The Contractor's DQC Plan shall provide and maintain an effective quality control program which will assure that all services required by this design-build contract are performed and provided in a manner that meets professional architectural and engineering quality standards. As a minimum, competent, independent reviewers identified in the DQC Plan shall technically review all documents. The same element that produced the

product shall not perform the independent technical review (ITR). The Contractor shall correct errors and deficiencies in the design documents prior to submitting them to the Government.

The Contractor shall include the design schedule in the master project schedule, showing the sequence of events involved in carrying out the project tasks within the specific contract period. This should be at a detailed level of scheduling sufficient to identify all major design tasks, including those that control the flow of work. The schedule shall include review and correction periods associated with each item. This should be a forward planning as well as a project-monitoring tool. The schedule reflects calendar days and not dates for each activity. If the schedule is changed, the Contractor shall submit a revised schedule reflecting the change within seven (7) calendar days. The Contractor shall include in the DQC Plan the discipline-specific checklists to be used during the design and quality control of each submittal. These completed checklists shall be submitted at each design phase as part of the project documentation. Example checklists can be found in ER 1110-1-12.

A Design Quality Control Manager who has the responsibility of being cognizant of, and assuring that all documents on the project have been coordinated, shall implement the DQC Plan. This individual shall be a person who has verifiable engineering or architectural design experience and is a registered professional engineer or architect. The Contractor shall notify the Contracting Officer, in writing, of the name of the individual, and the name of an alternate person assigned to the position.

The Contracting Officer will notify the Contractor, in writing, of the acceptance of the DQC Plan. After acceptance, any changes proposed by the Contractor are subject to the acceptance of the Contracting Officer.

### 3.2.4 Acceptance of Plan

Acceptance of the Contractor's plan is required prior to the start of design and/or construction. Acceptance is conditional and will be predicated on satisfactory performance during the design and construction phases. The Government reserves the right to require the Contractor to make changes in his CQC Plan and operations including removal of personnel, as necessary, to obtain the quality specified.

### 3.2.5 Notification of Changes

After acceptance of the CQC Plan, the Contractor shall notify the Contracting Officer in writing a minimum of seven calendar days prior to any of any proposed change. Proposed changes shall not be implemented prior to its acceptance by the Contracting Officer.

## 3.3 COORDINATION MEETINGS

After the Pre-design Conference and before the start of design and/or construction, and prior to acceptance by the Government of the Quality Control Plan, a Quality Control Coordination Meeting shall be held. The Contractor shall meet with the Contracting Officer or Authorized Representative to discuss the Contractor's quality control system. The CQC

Plan shall be submitted for review a minimum of [7] calendar days prior to the Coordination Meeting. During this meeting, a mutual understanding of the CQC system details shall be developed, including the forms for recording the CQC operations, design activities, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's management and control with the Government's Quality Assurance. Minutes of the meeting will be prepared by the Government and signed by both the Contractor and the Contracting Officer's Representative. The minutes shall become a part of the contract file. There may be occasions when subsequent conferences will be called by either party to reconfirm mutual understandings and/or address deficiencies in the CQC system or procedures that may require corrective action by the Contractor.

## 3.4 QUALITY CONTROL ORGANIZATION

### 3.4.1 Personnel Requirements

The requirements for the CQC organization are a CQC System Manager (CQCSM), a Design Quality Manager, and a sufficient number of additional qualified personnel to ensure contract compliance. The Safety and Health Manager shall receive direction and authority from the CQC System Manager and shall serve as a member of the CQC staff. Personnel identified in the technical provisions as requiring specialized skills to assure the required work is being performed properly will also be included as par of the CQC organization. The Contractor's CQC staff shall maintain a presence at the site at all times during progress of the work and have complete authority and responsibility to take any action necessary to ensure contract compliance. The CQC staff shall be subject to acceptance by the Contracting Officer.

The Contractor shall provide adequate office space, filing systems and other resources as necessary to maintain an effective and fully functional CQC organization. Complete records of all letters, material submittals, shop drawing submittals, schedules and all other project documentation shall be promptly furnished to the CQC organization by the Contractor. The CQC organization shall be responsible to maintain these documents and records at the site at all times, except as otherwise acceptable to the Contracting Officer.

### 3.4.2 CQC System Manager

The Contractor shall identify as CQC System Manager an individual within the onsite work organization who shall be responsible for overall management of CQC on the contract and have the authority to act in all CQC matters for the Contractor. The CQC System Manager shall be a graduate engineer, graduate architect, or a graduate of construction management with a minimum of 5 years construction experience on construction similar to this contract. The CQC System Manager, or an acceptable, qualified representative, shall be on site at all times during design and construction activities and shall be employed by the prime Contractor. The CQC System Manager shall be assigned no other duties. An alternate for the CQC System Manager shall be identified in the plan to serve in the event of the System Manager's absence. The requirements for the alternate shall be

the same as the designated CQC System Manager.

3.4.3 CQC Personnel (Construction)

In addition to CQC personnel specified elsewhere in the contract, the Contractor shall provide as part of the CQC organization specialized personnel to assist the CQC System Manager in the areas listed below. Unless otherwise stated, these individuals, when required, may be employees of the prime or subcontractor; shall be responsible to the CQC System Manager; be physically present at the construction site during work on their areas of responsibility; have the necessary education and/or experience in accordance with the experience matrix listed herein. These individuals may perform other duties but must be allowed sufficient time to perform their assigned quality control duties as described in the Quality Control Plan.

EXPERIENCE MATRIX

| | Area | Qualifications |
|---|---|---|
| a. | Civil | Graduate Civil Engineer with 2 years experience in the type of work being performed on this project or technician with 5 years related experience |
| b. | Mechanical | Graduate Mechanical Engineer with 2 years experience or technician with 5 years related experience |
| c. | Electrical | Graduate Electrical Engineer with 2 years related experience or technician with 5 years related experience |
| d. | Structural | Graduate Structural Engineer with 2 years experience or person with 5 years related experience |
| e. | Architectural | Graduate Architect with 2 years experience or person with 5 years related experience |
| f. | Environmental Specialist | Graduate Environmental Engineer with 3 years experience |
| g. | Submittals | Submittal Clerk with 1 year experience |
| h. | Occupied family housing | Person, customer relations type, coordinator experience |
| h. | Concrete, Pavements and Soils | Materials Technician with 2 years experience for the appropriate area |

If it is subsequently determined by the Contracting Officer that the minimum contract CQC requirements are not being met, the Contractor may be

required to provide additional staff personnel to the CQC organization at no cost to the Government.

### 3.4.4 Additional Requirement

In addition to the above experience and/or education requirements, the CQC System Manager and any alternates shall have completed the course entitled "Construction Quality Management For Contractors" within the past 5 years. This course is periodically offered at the General Contractors Association of Hawaii.

### 3.4.5 Organizational Changes

The Contractor shall maintain the CQC staff at full strength at all times. When it is necessary to make changes to the CQC staff, the Contractor shall revise the CQC Plan to reflect the changes and submit the changes to the Contracting Officer for acceptance. Requests shall include the names, qualifications, duties, and responsibilities of each proposed replacement. Upon acceptance of any changes, the Contractor shall revise the CQC plan to accurately reflect the changes. The CQC plan shall be kept current at all times during the life of the contract.

## 3.5 SUBMITTALS AND DELIVERABLES

Design submittals shall be made as required in Section 01012, DESIGN AFTER AWARD. Construction submittals shall be made as specified in Section 01330, SUBMITTAL PROCEDURES. The CQC organization shall be responsible for certifying that all submittals and deliverables are in compliance with the contract requirements. When Section 15950A, Heating, Ventilating and Air Conditioning (HVAC) Control Systems; Section 15951A, Direct Digital Control for HVAC; Section 15990A, Testing, Adjusting, and Balancing of HVAC Systems; or Section 15995A, Commissioning of HVAC Systems, are included in the contract, the submittals required by those sections shall be coordinated with Section 01330, Submittal Procedures, to ensure adequate time is allowed for each type of submittal required.

## 3.6 CONTROL

Contractor Quality Control is the means by which the Contractor ensures that the design and construction, to include that of designers of record, consultants, subcontractors and suppliers, comply with the requirements of the contract. At least three phases of control shall be conducted by the CQC System Manager for each definable feature of work (construction) as follows:

### 3.6.1 Preparatory Phase

This phase shall be performed prior to beginning work on each definable feature of work, after all required plans/documents/materials are approved/accepted, and after copies are at the work site. This phase shall include:

a. A review of each paragraph of applicable specifications.

b. A review of the contract drawings.

c. A check to assure that all materials and/or equipment have been tested, submitted, and approved.

d. Review of provisions that have been made to provide required control inspection and testing.

e. Examination of the work area to assure that all required preliminary work has been completed and is in compliance with the contract.

f. A physical examination of required materials, equipment, and sample work to assure that they are on hand, conform to approved shop drawings or submitted data, and are properly stored.

g. A review of the appropriate activity hazard analysis to assure safety requirements are met.

h. Discussion of procedures for controlling quality of the work including repetitive deficiencies. Document construction tolerances and workmanship standards for that feature of work.

i. A check to ensure that the Contracting Officer has accepted the portion of the plan for the work to be performed.

j. Discussion of the initial control phase.

k. The Government shall be notified at least 2 workdays in advance of beginning the preparatory control phase. This phase shall include a meeting conducted by the CQC System Manager and attended by the superintendent, other CQC personnel (as applicable), and the foreman responsible for the definable feature. The results of the preparatory phase actions shall be documented by separate minutes prepared by the CQC System Manager and attached to the daily CQC report. The Contractor shall instruct applicable workers as to the acceptable level of workmanship required in order to meet contract specifications.

3.6.2 Initial Phase

This phase shall be accomplished at the beginning of a definable feature of work. The following shall be accomplished:

a. A check of work to ensure that it is in full compliance with contract requirements. Review minutes of the preparatory meeting.

b. Verify adequacy of controls to ensure full contract compliance. Verify required control inspection and testing.

c. Establish level of workmanship and verify that it meets minimum acceptable workmanship standards. Compare with required sample panels as appropriate.

d. Resolve all differences.

e. Check safety to include compliance with and upgrading of the safety plan and activity hazard analysis. Review the activity analysis with each worker.

f. The Government shall be notified at least 1 workday in advance of beginning the initial phase. Separate minutes of this phase shall be prepared by the CQC System Manager and attached to the daily CQC report. Exact location of initial phase shall be indicated for future reference and comparison with follow-up phases.

g. The initial phase should be repeated for each new crew to work onsite, or any time acceptable specified quality standards are not being met.

### 3.6.3 Follow-up Phase

Daily checks shall be performed to assure control activities, including control testing, are providing continued compliance with contract requirements, until completion of the particular feature of work. The checks shall be made a matter of record in the CQC documentation. Final follow-up checks shall be conducted and all deficiencies corrected prior to the start of additional features of work that may be affected by the deficient work. The Contractor shall not build upon nor conceal non-conforming work.

### 3.6.3 Additional Preparatory and Initial Phases

Additional preparatory and initial phases shall be conducted on the same definable features of work if the quality of on-going work is unacceptable, if there are changes in the applicable CQC staff, onsite production supervision or work crew, if work on a definable feature is resumed after a substantial period of inactivity, or if other problems develop.

## 3.7 TESTS

### 3.7.1 Testing Procedure

The Contractor shall perform specified or required tests to verify that control measures are adequate to provide a product that conforms to contract requirements. Upon request, the Contractor shall furnish to the Government duplicate samples of test specimens for possible testing by the Government. Testing includes operation and/or acceptance tests when specified. The Contractor shall obtain the services of an industry-recognized testing laboratory approved by the Honolulu Engineer District (HED), or may establish a testing laboratory at the project site acceptable to the Contracting Officer. No approved Contractor's Quality Control (CQC) laboratory may act as both CQC materials testing laboratory and the Government's Quality Assurance (QA) laboratory on the same project. Additionally, tests contractually required to be performed by an industry-recognized testing laboratory shall not be accomplished by the Contractor-established on-site laboratory.

The Contractor's testing procedures shall include the following activities and shall record and provide the following data:

a. Verify that testing procedures comply with contract requirements.

b. Verify that facilities and testing equipment are available and comply with testing standards.

c. Check test instrument calibration data against certified standards.

d. Verify that recording forms and test identification control number system, including all of the test documentation requirements, have been prepared.

e. Results of all tests taken, both passing and failing tests, shall be recorded on the CQC report for the date taken. Specification paragraph reference, location where tests were taken, and the sequential control number identifying the test shall be given. If approved by the Contracting Officer, actual test reports may be submitted later with a reference to the test number and date taken. An information copy of tests performed by an offsite or commercial test facility shall be provided directly to the Contracting Officer. Failure to submit timely test reports as stated may result in nonpayment for related work performed and disapproval of the test facility for this contract.

3.7.2 Testing Laboratories

3.7.2.1 Validation Requirements

Any laboratory used by the Contractor for testing aggregate, concrete, bituminous materials, soils, rock, and other construction materials must possess a current validation letter prior to performance of testing by that laboratory. Validation shall be obtained through the Corps of Engineers Materials Testing Center (MTC) in Vicksburg, MS. Validation may be initiated by completing an Inspection Request Form and questionnaire that are available directly from the MTC or from the MTC website, http://www.wes.army.mil/SL/MTC/inspection.htm.

The MTC also maintains a website listing validated laboratories at: http://www.wes.army.mil/SL/MTC/ValStatesTbl.htm.

3.7.2.2 Exception

The validation letters already obtained from HED in 2001 and 2002 will be considered acceptable proof of validation through its expiration date. Upon expiration, laboratories must be revalidated by the MTC, as required above. The validation status of laboratories in Hawaii may be found at: http://www.poh.usace.army.mil/Construction/LabValidation/labvalidation.html.

3.7.3 Capability Check

The Government reserves the right to check laboratory equipment in the proposed laboratory for compliance with the standards set forth in the

contract specifications and to check the laboratory technician's testing procedures and techniques. Laboratories utilized for testing soils, concrete, asphalt, and steel shall meet criteria detailed in ASTM D 3740 and ASTM E 329.

### 3.7.4 Capability Recheck

If the selected laboratory fails the capability check, the Contractor shall reimburse the Government for each succeeding recheck of the laboratory or the checking of a subsequently selected laboratory. Such costs will be deducted from the contract amount due the Contractor.

### 3.7.5 Onsite Laboratory

The Government reserves the right to utilize the Contractor's control testing laboratory and equipment to make quality assurance tests and to check the Contractor's testing procedures, techniques, and test results at no additional cost to the Government.

### 3.7.6 Furnishing or Transportation of Samples for Testing

Costs incidental to the transportation of samples or materials shall be borne by the Contractor. *Samples of materials for test verification and acceptance testing by the Government shall be delivered to a testing laboratory on the Island of Oahu, State of Hawaii, designated by the Contracting Officer. Coordination for each specific test, exact delivery location, and dates will be made through the Government field office.

## 3.8 COMPLETION INSPECTION

### 3.8.1 Punch-Out Inspection

Near the completion of all work or any increment thereof established by a completion time stated in the Special Clause entitled "Commencement, Prosecution, and Completion of Work," or stated elsewhere in the specifications, the CQC System Manager shall conduct an inspection of the work and develop a punch list of items which do not conform to the approved drawings and specifications. Such a list of deficiencies shall be included in the CQC documentation, as required by paragraph DOCUMENTATION below, and shall include the estimated date by which the deficiencies will be corrected. The CQC System Manager or staff shall make a second inspection to ascertain that all deficiencies have been corrected. Once this is accomplished, the Contractor shall notify the Government that the facility is ready for the Government Pre-Final inspection.

### 3.8.2 Pre-Final Inspection

The Government will perform this inspection to verify that the facility is complete and ready to be occupied. The CQC System Manager shall develop a punch list of items that do not conform to the contract documents. The Government will review the punch list and add to or correct the items listed. The CQC System Manager shall incorporate Government comments and provide a Pre-Final Punch List. The Contractor's CQC System Manager shall ensure that all items on this list have been corrected before notifying the

Government to schedule a Final inspection with the customer. Any items noted on the Pre-Final inspection shall be corrected in a timely manner. These inspections and any deficiency corrections required by this paragraph shall be accomplished within the time slated for completion of the entire work or any particular increment thereof if the project is divided into increments by separate completion dates.

### 3.8.3 Final Acceptance Inspection

The Contractor's Quality Control Inspection personnel, plus the superintendent or other primary management person, and the Contracting Officer's Representative shall be in attendance at this inspection. Additional Government personnel including, but not limited to, those from Base/Post Civil Facility Engineer user groups, and major commands may also be in attendance. The Contractor shall notify the Contracting Officer at least 14 days prior to the proposed final acceptance inspection and shall include the Contractor's assurance that all specific items previously identified to the Contractor as being unacceptable, along with all remaining work to be performed under the contract, will be complete and acceptable by the date scheduled for the final acceptance inspection. The final acceptance inspection will be formally scheduled by the Contracting Officer based upon results of the Pre-Final inspection. Failure of the Contractor to have all contract work acceptably complete for this inspection will be cause for the Contracting Officer to bill the Contractor for the Government's additional inspection cost in accordance with the contract clause titled "Inspection of Construction".

### 3.8.4 Post Completion Feedback Meeting and Preparation of Written Minutes

At the completion of this project, the CQC Systems Manager will host a meeting to review the project and to discuss lessons learned during the design and construction of the project. This meeting should be scheduled for 4 hours on-site and should be attended by the Project Manager and representatives of the designers of record, consultants, and major subcontractors, including mechanical and electrical. The Contracting Officer will invite members of the design team to participate in this meeting. Minutes of the meeting shall be prepared by the CQC System Manager and submitted to the Government.

## 3.9 DOCUMENTATION

The Contractor shall maintain current records providing factual evidence that required quality control activities and/or tests have been performed. These records shall include the work of subcontractors and suppliers and shall be prepared using government-provided software, QCS (see Section 01312 ), that includes, as a minimum, the following information:

a. Contractor/subcontractor and their area of responsibility.

b. Operating plant/equipment with hours worked, idle, or down for repair.

c. Work performed each day, giving location, description, and by whom. When Network Analysis (NAS) is used, identify each phase of

work performed each day by NAS activity number.

d. Test and/or control activities performed with results and references to specifications/drawings requirements. The control phase should be identified (Preparatory, Initial, Follow-up). List deficiencies noted along with corrective action.

e. Quantity of materials received at the site with statement as to acceptability, storage, and reference to specifications/ drawings requirements.

f. Submittals reviewed, with contract reference, by whom, and action taken.

g. Off-site surveillance activities, including actions taken.

h. Job safety evaluations stating what was checked, results, and instructions or corrective actions.

i. Instructions given/received and conflicts in plans and/or specifications.

j. Contractor's verification statement.

These records shall indicate a description of trades working on the project; the number of personnel working; weather conditions encountered; and any delays encountered. These records shall cover both conforming and deficient features and shall include a statement that equipment and materials incorporated in the work and workmanship comply with the contract. Unless otherwise directed by the Contracting Officer the original and one copy of these records in report form shall be furnished to the Government daily within 24 hours after the date covered by the report, except that reports need not be submitted for days on which no work is performed. As a minimum, one report shall be prepared and submitted for every 7 days of no work and on the last day of a no work period. All calendar days, beginning with the construction NTP, shall be accounted for throughout the life of the contract. The first report following a day of no work shall be for that day only. Reports shall be signed and dated by the CQC System Manager. The report from the CQC System Manager shall include copies of test reports and copies of reports prepared by all subordinate quality control personnel.

## 3.10 NOTIFICATION OF NONCOMPLIANCE

The Contracting Officer will notify the Contractor of any detected noncompliance with the foregoing requirements. The Contractor shall take immediate corrective action after receipt of such notice. Such notice, when delivered to the Contractor at the work site, shall be deemed sufficient for the purpose of notification. If the Contractor fails or refuses to comply promptly, the Contracting Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken. No part of the time lost due to such stop orders shall be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

### 1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES:

SD-01 Pre-Construction Submittals

Organization Plan; G.

Provide a diagram depicting the proposed management organization. The chart shall clearly identify lines of authority and areas of responsibility. Include a narrative description of how the management team will operate, and the specific duties and responsibilities of the key individuals.

The narrative shall describe the Offeror's proposed on-site organization and structure, and shall describe how the Offeror intends to monitor and control timeliness, quality, and safety of

the work at the job site, including the work of any subcontractors on all phases of the contract.

Identify the individuals proposed to fill the key management positions: Project Manager, Project Superintendent, Contractor Quality Control System Manager, Design Quality Control Manager, Safety and Health Manager. Provide resumes for each individual. Resumes must support the individual’s qualifications to perform in the selected position.

Provide copies of letters of direction to each key personnel from an appropriate officer of the company.

If the information submitted in proposal Volume I, Factor III is current and complete, submit one copy of this information. However, if any of the proposal information is not current or requires revision, in addition to the copy of the proposal information, submit four copies of all additions and changes for Contracting Officer acceptance.

Accident Prevention Plan. G.

Activity Hazard Analyses, G.

SD-03 Product Data

Equipment Data.

A list of all equipment furnished under this contract. This list shall include, but not be limited to, each piece of equipment with a serial number, and shall include all information shown on the manufacturer's nameplate, so as to positively identify the piece of equipment. This list shall also include the cost of each piece of equipment (less installation costs) F.O.B. construction site. This list shall be furnished as soon as possible after equipment is purchased. The list shall consist of one (1) reproducible and three (3) copies, and shall be furnished to the Contracting Officer not later than thirty (30) calendar days prior to completion of any segment of the contract work that has an incremental completion date.

Recovered Material Report

The Contractor shall provide a report listing all products meeting EPA guidelines for products containing recovered materials and quantity used for this project.

SD-06 Test Reports

Inspection of Existing Conditions.

A written report with color photographs noting the condition of the existing facilities at the time of the inspection. One copy of the report including photographs shall be submitted to the Contracting Officer, prior to construction.

SD-06 Test Records

Dust Control; G.

Method(s) of dust control.

Excavation/Trenching Clearance.

Prior to start of any excavation or trenching work, the Contractor shall obtain clearance, in writing, from the appropriate communications agency and base or area engineer. Copies of all correspondence shall be provided the Contracting Officer. Normal coordination time for obtaining the necessary permits is approximately fifteen (15) calendar days. The Contractor shall advise the Contracting Officer promptly when it appears that the normal coordination time will be exceeded.

Condition of Contractor's Operation or Storage Area.

The Contractor shall submit to the Contracting Officer photographs and/or videos depicting the condition of the Contractor's Operation or Storage Area.

SD-07 Certificate

Products Containing Recovered Materials.

The Contractor shall submit manufacturer's certification attesting that product meets or exceeds EPA's recovered material guidelines.

## 1.3 PROJECT MANAGEMENT ORGANIZATION

### 1.3.1 General

The Contractor is responsible for ensuring that the contract is adequately staffed to manage all of the work in full accordance and compliance with the contract requirements.

### 1.3.2 Organization Plan

The contractor shall submit an organization plan describing the organization it intends to structure for managing this contract. The plan shall include lines of authority, position responsibilities, and qualifications of the proposed staff. The project staff shall minimally consist of the following key personnel: Project Manager, Project Superintendent, Contractor Quality Control System Manager, Design Quality Control Manager, Safety and Health Manager. Each of the individuals selected to fill these positions is subject to acceptance by the Contracting Officer.

### 1.3.3 Organizational Changes

The Contractor shall maintain the project management staff at full strength at all times. When it is necessary to make changes to the staff, the Contractor shall revise the Organization Plan to reflect the changes and submit the changes to the Contracting Officer for acceptance at least fourteen (14) calendar days prior to implementation of the changes.

Substitutions for any accepted key personnel must be submitted for review and acceptance by the Contracting Officer prior to the start of work by that individual. The Contractor is informed that the Government will be allowed at least 30 days to respond. Any delays resulting from this process shall be the responsibility of the contractor and shall not be a basis for any equitable contract adjustment.

1.3.4 Project Manager

The Project Manager shall be responsible for the contractor's overall management and coordination of this contract and shall be the central point of contact with the Government for performance of all work under this contract including warranty. The Project Manager shall oversee construction accomplishment, administer all instructions, and answer all questions from the Contracting Officer pertaining to the work during the life of the contract, including the warranty period. The Project Manager shall be responsible for the complete coordination of all work in this contract. The Project Manager will be responsible for ensuring that adequate internal controls and review procedures are followed in order to eliminate conflicts, errors and omissions, and for ensuring that all technical requirements are met. Another individual may be designated to temporarily act for the Project Manager, however, forty-eight (48) hours advance notice in writing of such change shall be requested to the Contracting Officer, and no change shall be made without prior acceptance by the Contracting Officer.

The Project Manager shall have a recognized four-year college degree in engineering, architecture, or related technical field, and at least five (5) years experience in managing and supervising Department of Defense construction projects of similar size and scope.

1.3.5 Project Superintendent

A Project Superintendent shall be assigned. This individual shall have a minimum of five years experience as a superintendent on Department of Defense construction projects similar in size and scope to this contract. The project superintendent shall have overall responsibility for all operations on the jobsite. The superintendent shall be assigned no other duties.

1.3.6 Contractor Quality Control

To assure compliance with contract requirements, the Contractor shall establish and maintain quality control for materials and work, including design, covered by all sections of the TECHNICAL REQUIREMENTS in accordance with Section 01451 CONTRACTOR QUALITY CONTROL. Records shall be maintained for all operations including sampling and testing.

1.3.7 Safety

1.3.7.1 General

Site activities performed in conjunction with this contract may pose safety hazards that require specialized expertise to effectively address and eliminate. The Contractor shall be responsible for preparing and

implementing an effective safety and health program throughout the entire duration of the contract.

1.3.7.2 Accident Prevention Plan (APP)

The contractor shall prepare an Accident Prevention Plan in accordance with the provisions of FAR 52.236-13 (Section 00700) and Section 00800, paragraph S-36.18. The Accident Prevention Plan shall address the contractor's overall safety program for the entire contract. The APP shall consist of the forms and documents listed in Section 00800, S36.18, ACCIDENT PREVENTION PLAN, covering the overall safety considerations for the contract as a whole.

1.3.7.3 Site-Specific Safety and Health Plan (SSHP)

The contractor shall prepare a site-specific safety and health plan addressing the safety aspects specific to the work ordered. Work on a feature of work shall not commence prior to receiving the Contracting Officer's written acceptance of both the contract Accident Prevention Plan and the site-specific safety and health plan.

The SSHP shall be prepared in accordance with the requirements specified in this section and shall comply with all federal, state, and local health and safety requirements, e.g., the Occupational Safety and Health Administration (OSHA) requirements (29 CFR 1910 and 1926) and the U.S. Army Corps of Engineers Safety and Health Requirements Manual (EM 385-1-1). The SSHP shall address those elements that are specific to the feature of work that have potential for negative effects on the safety and health of workers, the public, and other personnel on site.

An Activity Hazard Analysis (AHA), POD Form 184-R, rev 16 Oct 98, shall be submitted for all phases of construction specific to the feature of work and worksite. Work on a construction phase cannot begin until the AHA is submitted and accepted.

The SSHP shall identify the individual responsible for jobsite safety. This individual shall be present at the jobsite at all times during construction. Copies of the accepted SSHP and Accident Prevention Plan shall be available at the jobsite at all times. All workers shall know the location of these plans. All workers shall receive a safety briefing covering applicable sections of these plans prior to the start of construction.

Daily safety and health inspections shall be conducted to determine if site operations are conducted in accordance with the accepted SSHP and contract requirements. Results and observations made during these inspections shall be noted in the contractor's daily report.

1.3.7.4 Safety and Health Manager

The Safety and Health Manager shall have direct responsibility for the overall management of the contractor's Safety Program for the entire contract, as required by the US Army Corps of Engineers Safety and Health Requirements Manual, EM385-1-1, and other applicable safety standards. This individual shall have a minimum of five (5) years experience in safety on Department of Defense construction projects similar in size and scope to this contract. All members of the safety staff are subject to review and acceptance by the Contracting Officer. The Safety and Health Manager shall

have no other duties.

## 1.4 AS-BUILT DRAWINGS

As-built drawings shall be in accordance with Section 01780 CLOSEOUT SUBMITTALS.

## 1.5 DUST CONTROL

Dust control measures shall be enforced throughout areas of demolition activity. A 15 foot high minimum dust/environmental screen barrier shall be provided where construction activity occurs adjacent to other activities and facilities. Dust barriers shall be equipped with posts and bracing to maintain the barrier in a plumb position. Barrier fabric shall be of sufficient strength to resist wear and tear for the duration of the construction activity. Dust barriers shall be approved by the Contracting Officer.

accordance with Section 02220 DEMOLITION.

## 1.6 PROTECTION

The Contractor shall take all necessary precautions to insure that no damages to private or public property will result from his operations. Any such damages shall be repaired or property replaced by the Contractor in accordance with the CONTRACT CLAUSES entitled "PERMITS AND RESPONSIBILITIES" and "PROTECTION OF EXISTING VEGETATION, STRUCTURES, EQUIPMENT, UTILITIES, AND IMPROVEMENTS", without delay, and at no cost to the Government.

### 1.6.1 Warning Signs and Barricades

The Contractor shall be responsible for posting warning signs or erecting temporary barricades to provide for safe conduct of work and protection of property.

### 1.6.2 Protection of Grassed and Landscaped Areas

The Contractor's vehicles shall be restricted to paved roadways and driveways. Vehicles shall not be driven or parked on grassed and/or landscaped areas except when absolutely necessary for the performance of the work and approved in advance by the Contracting Officer. Grassed or landscaped areas damaged by the Contractor shall be restored to their original condition without delay and at no cost to the Government.

### 1.6.3 Protection of Trees and Plants

Where necessary, tree branches and plants interfering with the work may be temporarily tied back by the Contractor to permit accomplishment of the work in a convenient manner, so long as they will not be permanently damaged thereby. If this is not feasible, the Contracting Officer may prune them, subject to written approval.

### 1.6.4 Protection of Building From the Weather

The interior of the building and all materials and equipment shall be protected from the weather at all times.

## 1.7 RESTORATION WORK

Existing conditions or areas damaged or disturbed by the Contractor's operations shall be restored to their original condition, or near original condition as possible, to the satisfaction of the Contracting Officer.

## 1.8 REMOVAL AND DISPOSAL

The Contractor shall salvage or recycle waste to the maximum extent practical as it relates to the capabilities of local industries. A record of the quantity of salvaged or recycled materials shall be maintained by the Contractor during the length of the project and submitted to the Contracting Officer at acceptance of the project. Quantities shall be recorded in the unit of measure of the industry. Reuse of materials on the site shall be considered a form of recycling. An example of such reuse would be the use of acceptable excavated materials as fill.

### 1.8.1 Title to Materials

Title to all materials and equipment to be removed, except as indicated or specified otherwise, is vested in the Contractor upon receipt of notice to proceed. The Government will not be responsible for the condition, loss or damage to such property after the Contractor's receipt of notice to proceed. Items indicated to be removed shall be removed and disposed of by the Contractor outside the limits of Government-controlled property at the Contractor's responsibility and expense before the completion and final acceptance of the work and such materials shall not be sold on the site.

### 1.8.2 Rubbish and Debris

Rubbish and debris shall be removed from Government-controlled property daily unless otherwise directed, so as not to allow accumulation inside or outside the building. Materials that cannot be removed daily shall be stored in areas designated by the Contracting Officer.

## 1.9 INTERFERENCE WITH GOVERNMENT OPERATIONS

The Contractor shall establish work procedures and methods to prevent interference with existing operations within or adjacent to the construction area. Free passage into adjoining or adjacent buildings not in the contract will not be permitted except as approved by the Contracting Officer. Procedures and methods shall also provide for safe conduct of work and protection of property that is to remain undisturbed.

### 1.9.1 Coordination

The Contractor shall coordinate all work with the Contracting Officer to minimize interruption and inconvenience to the occupants or to the Government. Scheduling and programming of work will be established during the pre-construction conference.

### 1.9.2 Materials and Equipment

All materials and equipment required to complete the project shall be on hand before work is started.

### 1.9.3 Utilities and Facilities

All utilities and facilities within the area shall remain operable and shall not be affected by the Contractor's work, unless otherwise approved in writing in advance by the Contracting Officer.

### 1.9.4 Staking and Flagging Existing Utilities

The Contractor, prior to start of any excavation or trenching work, shall verify the location of all utility lines shown on the drawings which are within the areas of work, and shall mark, stake, or flag each utility line along trench alignments and under areas of excavation under this project, as approved. Existing utility lines shall be located by walking trench alignments with approved equipment for locating underground pipes and cables. Utility lines so located shall be noted on the drawings.

## 1.10 CONTRACTOR'S OPERATIONS OR STORAGE AREA

The Contractor’s operation and storage area is limited to areas within the limits of work.

## 1.11 CONTRACTOR PARKING

Parking for the Contractor’s, his employee’s, and subcontractors’ personal vehicles is limited to areas within the limits of work. Personal vehicle parking is prohibited anywhere else within the boundaries of Schofield Barracks Military Base.

## 1.12 GOVERNMENT PROJECT OFFICE

The Contractor shall provide, for use by Government supervisory and inspection personnel, a job-site office space with a floor area not less than 500 square feet, with minimum twice-per-week janitorial service. This office space may be within the Contractor's project office building if adjacent to the job site and if separated by a solid partition; otherwise a separate facility, adjacent to the job site, shall be provided. The office shall be provided with windows and screens, air conditioning to maintain not more than 22 degrees C, electricity, wall outlets, ceiling lights, (1) telephone and (3) cellular phones or (4) cellular phones, (3) office desks with drawers, (3) layout tables, (5) ergonomic chairs, (4) legal-size five-drawer locking file cabinets, (3) 3-shelf bookcase, (3) plan racks, (1) fire extinguisher, and (3) computers.

Provide potable drinking water and temporary toilet facilities for Government personnel. Contractor's copier and fax machine shall be available for use by Government personnel. Contractor shall provide (4) vehicle parking spaces for Government personnel at the project office. The cost of utilities including two telephone lines with different telephone numbers (one number for the telephone instrument and one for the modem), air conditioning, and operation and maintenance costs of the Government project office shall be borne by the Contractor. The government will be responsible for its long distance calls. Upon completion of the project, the project office and furnishings shall be removed and disposed of by the Contractor.

### 1.12.1 Computer Requirements

The Contractor shall provide computers for use by Government personnel assigned to this contract. These computers shall be Dell Optiplex GX260 or approved equal (proposed "equal" systems require approval by the Government prior to contract award), minimally configured as follows:

| **Feature** | **Requirement** |
|---|---|
| OptiPlex GX260 Small Minitower | Pentium ® 4 Processor, 2.40GHz, 533FSB, 512K |
| Memory: | Cache, Intel Gigabit NIC, 1.0GB DDR Non-ECC SDRAM (2DIMMs) |
| Keyboards: | Dell PS/2 Keyboard in Gray, No Hot Keys |
| Monitors: | Dell 17 inch M782 flat CRT color monitor (16.0 viewable) |
| Video Boards: | 32MB, ATI, Radeon ™ 7500 |
| Boot Hard Drives: | 40GB EIDE 7200RPM |
| Card Reader: | 5.25 inch PCMCIA Reader with Required PCI Controller Card |
| Floppy Drives: | Internal 1.44MB 3.5 Inch Floppy Drive |
| Operating System(s): | Windows ® 2000 Professional, SP3 with CD using NTFS |
| Mouse. | Microsoft PS/2 2-Button IntelliMouse with Scroll |
| Network Adapters (NICs): | Integrated Intel Gigabit (10/100/1000) with Alert Standards Format |
| Modems: | Dell V.92 PCI Data/Fax Controllerless Modem for Windows |
| 1st Removable Media and DVD+RW Options: | 48X CD-RW/DVD Combo, with Roxio Easy CD Creator TM and DVD Decode |
| Audio Solutions | Integrated Sound Blaster Compatible |
| Speakers: | Harman Kardon 206 Speakers |
| Documentation: | Resources CD contains Diagnostics and Driver for Dell OptiPlex Systems |
| Additional Hard Drive or ZIP Drive: | Zip 250 Disk Drive |
| Energy Star Label: | Energy Star Label |
| Hardware Support Services: | 3Yr Same Day 4Hr Response Parts + Onsite Labor (M-F 8am-6pm) |
| Optional Support Services | Gold Technical Support, OptiPlex, 3 Years |
| Installation Support: | No Installation |
| Mouse Pad: | Mouse Pad |
| Power Protection: | Surgemaster Gold 9 outlet |
| Additional Software: | Microsoft Office 2000<br>Adobe Acrobat 5.0 |

The Contractor shall have delivered all required computer hardware and software directly to the Government Project Office in factory-sealed, unopened boxes. Any boxes delivered with damaged or tampered seals will be rejected by the Government and shall be replaced by the Contractor at no additional cost to the Government. The Government will perform set up of the computers in the Government Project Office.

The Contractor shall provide all software licenses and software updates for the duration of the contract. Hardware shall be provided with a 3-year manufacturer's onsite maintenance contract. Should the construction contract last longer than 3 years, at the end of the maintenance contract, the Contractor shall provide new computers, similar to the above, except

configured to the standard at that time. The Government will provide specifications for replacement workstations and hardware.

At the end of the construction contract, the Government will turn over all contractor-provided hardware and software to the Contractor. Hard drives will be wiped clean of all software, including the operating system.

1.12.1.1 Other Devices (minimum requirements)

Printer: Hewlett-Packard Laserjet 5100TN or 5100DTN or approved equal (must be HP PCL compatible), Digital Camera: Kodak LS443 with additional 256 MB memory card, or approved equal.

1.12.1.2 Connectivity Requirements

The Government Project Office shall be provided with one high speed internet connection (RoadRunner ™ or DSL) with a minimum download speed of 2 Mbps and a minimum upload speed of 384 kbps.

1.12.1.3 Networking Requirements

The Government Project Office shall be configured with a local area network that includes a hub with a minimum of five (5) ports. Wiring shall be CAT5 twisted pair cabling terminated with RJ-45 connectors, which will run from the cable-modem/hub to each of the workstations and/or other devices.

1.13 WORKING DIRECTIVES

1.13.1 Working Hours

All work shall be performed between the hours of 0730 to 1600 HST, Monday through Friday. No work shall be accomplished on Saturdays, Sundays, and all federal holidays, without written permission from the Contracting Officer. Such written permission shall be available at the jobsite at all times during construction.

1.13.2 Phasing

Buildings 356, 357, and 358 will be turned over to the Contractor no earlier than February 1, 2004, but no later than March 1, 2004. Building 355 will be turned over to the Contractor no earlier than February 1, 2005, but no later than March 1, 2005. The Contractor will only have limited access to all buildings prior to their turnover. Work in the buildings cannot start until the building is turned over to the Contractor. All utilities in the buildings shall remain fully operational until the building is turned over to the Contractor.

1.14 COMMERCIAL TELEPHONE SERVICE LINES

Availability of existing commercial telephone service lines are extremely limited and/or non-existent. Contractor shall coordinate with Verizon Hawaii to verify the extent of commercial telephone service lines available and what actions may be necessary to obtain said service in the magnitude required to satisfy its operational requirements. Notwithstanding the actual level of commercial telephone service lines available, the Contractor shall be responsible for all costs and necessary actions.

## 1.15 INSPECTION

### 1.15.1 Final Inspection and Acceptance

The Contractor shall give the Contracting Officer, a minimum of fourteen (14) calendar days advance notice prior to final inspection for acceptance by the Contracting Officer. The Contractor upon notification by the Contracting Officer shall promptly and satisfactorily correct all deficiencies found on final inspection.

## 1.16 USE OF PRODUCTS CONTAINING RECOVERED MATERIALS

Recovered materials are materials manufactured from waste material and byproducts that have been recycled or diverted from solid waste. The Contractor shall give preference to products containing recovered material when price, performance, and availability meet project requirements. A listing of products, including the recommended recovered material content, is provided by the Environmental Protection Agency at http://www.epa.gov/cpg/products.htm. Only those products having recovered material content equal to or greater than EPA guidelines shall be used to meet this requirement.
